Introduction

Ninety percent of a child’s brain growth occurs before kindergarten and the quality of a child’s early experiences impacts whether their brain will develop in positive ways that promote learning. First Things First (FTF) was created by Arizonans to help ensure that Arizona children have the opportunity to arrive at kindergarten prepared to be successful. Understanding the critical role the early years play in a child’s future success is crucial to our ability to foster each child’s optimal development and, in turn, impact all aspects of wellbeing of our communities and our state.

This Needs and Assets Report for the FTF Salt River Pima-Maricopa Indian Community Region helps community leaders and decision-makers understand the needs of young children, the resources available to meet those needs and gaps that may exist in those resources. Data collection and analysis for the 2020 report were completed prior to the COVID-19 pandemic and, therefore, do not reflect the impact of COVID-19 on families with young children and the services that support them. The report is organized by topic areas pertinent to young children in the region, such as the population characteristics or educational indicators. Within each topic area are sections that set the context for why the data found in the topic areas are important (Why it Matters), followed by a section that includes available data on the topic (What the Data Tell Us).

The FTF Salt River Pima-Maricopa Indian Community Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options when it comes to supporting the healthy development of young children in their care. It is our sincere hope that this information also will help guide community conversations about how we can best support school readiness for all children in the Salt River Pima-Maricopa Indian Community Region. To that end, this information may be useful to stakeholders in the area as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to 5 years old throughout the region.
Acknowledgments

The FTF Salt River Pima-Maricopa Indian Community Regional Council wants to thank the Arizona Department of Economic Security, the Arizona Department of Health Services, the Arizona Department of Education and the U.S. Census Bureau, for their contributions of data for this report and their ongoing support and partnership with FTF on behalf of young children.

To the current and past members of the Salt River Pima-Maricopa Indian Community Regional Council, your vision, dedication and passion have been instrumental in improving outcomes for young children and families within the region. Our future efforts will build upon those successes with the ultimate goal of building a comprehensive early childhood system for the betterment of young children within the region and the entire state.
LETTER FROM THE CHAIR

May 8, 2020

Message from the Chair:

Since the inception of First Things First, the Salt River Pima-Maricopa Indian Community Regional Partnership Council has taken great pride in supporting evidence-based and evidence informed early childhood programs that are improving outcomes for young children. Through both funded and unfunded approaches, the early childhood programs and services supported by the regional council have strengthened families, improved the quality of early learning, and enhanced the health and well-being of children birth to 5 years old in our community.

This impact would not have been possible without data to guide our discussions and decisions. One of the primary sources of that data is our regional Needs and Assets report, which provides us with information about the status of families and young children in our community, identifies the needs of young children, and details the supports available to meet those needs. Along with feedback from families and early childhood stakeholders, the report helps us to prioritize the needs of young children in our area and determine how to leverage First Things First resources to improve outcomes for young children in our communities.

The Salt River Pima-Maricopa Indian Community Regional Council would like to thank our Needs and Assets vendor, the University of Arizona Norton School of Family and Consumer Sciences, for their knowledge, expertise and analysis of the Salt River Pima-Maricopa Indian Community region. Their partnership has been crucial to our development of this report and to our understanding of the extensive information contained within these pages.

As we move forward, the First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council remains committed to helping more children in our community arrive at kindergarten prepared to be successful by funding high-quality early childhood services, collaborating with system partners to maximize resources, and continuing to build awareness across all sectors of the importance of the early years to the success of our children, our communities and our state.

Thanks to our dedicated staff, volunteers and community partners, First Things First has made significant progress toward our vision that all children in Arizona arrive at kindergarten healthy and ready to succeed.

Thank you for your continued support.

Sincerely,

Christine McIntier, Chair

Executive Summary

Regional Boundaries
The boundaries of the First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council are those of the Salt River Reservation. The Salt River Pima-Maricopa Indian Community is a sovereign tribe located in the metropolitan Phoenix area. The Community was established by Executive Order on June 14, 1878, and it consists of 52,600 acres bordering the cities of Scottsdale, Tempe, Mesa, and Fountain Hills. The Salt River Pima-Maricopa Indian Community is home to the Pima (‘Akimel O’Odham,’ River People) and the Maricopa (‘Xalychidom Pipaash,’ People who live toward the water). When First Things First was established by the passage of Proposition 203 in November 2006, the government-to-government relationship with federally-recognized tribes was acknowledged. Each tribe with tribal lands located in Arizona was given the opportunity to participate within a First Things First designated region or elect to be designated as a separate region. The Salt River Pima-Maricopa Indian Community Region was one of 10 Tribes who chose to be designated as its own region. This decision must be ratified every two years, and the Salt River Pima-Maricopa Indian Community has opted to continue to be designated as its own region.

Population Characteristics
According to the 2010 U.S. Census, the total population of the Salt River Pima-Maricopa Indian Community Region was 6,289, of whom 626 were children ages birth to five years. About one in five (17%) of the 380 households in the region had one or more children in this age range. The proportion of households with young children is lower in the region than in all Arizona reservations combined (26%) but is similar to Maricopa County (17%). The number of births per year in the region remained relatively constant from 2013 to 2017, with 100 births in calendar year 2017.

The majority of young children in the Salt River Pima-Maricopa Indian Community Region (91%) are American Indian. This proportion is similar to that in all Arizona reservations combined (92%) but substantially higher than across the state (6%). In addition, one in five young children in the region (20%) are Hispanic, a proportion that is higher than in all Arizona reservations combined (9%). Similarly, over half of adults in the region identify as American Indian (57%), while in Arizona only four percent of adult residents identify that way. This proportion, however, is notably lower than that in all Arizona reservations combined (88%). According to the First Things First Salt River Pima-Maricopa Indian Community 2018 Needs and Assets Report, the reason behind this difference is that the Community has two long-term leases for two trailer parks located in District C (“Roadrunner” and “Shadow Mountain”), where most of the residents (72%) are not American Indian: they are winter residents, some of whom are
Canadian citizens. One of the leases ended on August 5, 2019 and there are no remaining residents at the Roadrunner Trailer Park. The second long-term lease for “Shadow Mountain” ends in 2026. These changes in land leases may result in an increase in the proportion of residents in the region identifying as American Indian in future reports. The majority of births in the region in 2017 (82%) were to mothers who identify as American Indian.

Seven percent of young children (ages 0-5) in the Salt River Pima-Maricopa Indian Community Region live with one or two foreign-born parents, more than twice that in all Arizona reservations combined (3%). Eight percent of individuals ages five or older in the region speak a language other than English or Spanish at home. This proportion is lower than that in all Arizona reservations combined (50%), but similar to the state (6%). The Salt River Pima-Maricopa Indian Community Region has a high English-language proficiency. Three percent of the population five and older speak another language at home and do not speak English “very well”. Similarly, only three percent of the households in the region are considered “limited English speaking,” compared to 12 percent in all Arizona reservations combined.

A higher proportion of young children in the Salt River Pima-Maricopa Indian Community Region live in households with two parents or two step-parents compared to children in all Arizona reservations combined (33% vs 27%). Fourteen percent of young children in the region live with relatives who are not their parents, also a higher proportion than in all Arizona reservations combined (8%). Thirty-seven percent of young children (ages 0-5) in the region live in a grandparent’s household. Of the 515 children (ages 0-17) living in a grandparent’s household, close to half (47%) live with a grandparent who is responsible for them.

**Economic Circumstances**

Sixty-one percent of young children (ages 0-5) in the Salt River Pima-Maricopa Indian Community Region live in poverty. This rate is higher than that of young children in all Arizona reservations combined (54%) and substantially higher than the state (26%). The poverty rate for young children in the region is also notably higher than the rate for the region’s population as a whole (28%).

The median income for all families in the region is $38,903, much lower than in Maricopa County ($69,647), and the state of Arizona ($63,812). Single female-headed families with

---

1 Please note that the most recent estimates from the American Communities Surveys (ACS) no longer specify what those other languages are. Based on ACS data included in previous Needs and Assets Reports for the Salt River Pima-Maricopa Indian Community Region, it is likely that the other languages spoken at home in the region are Native North American languages. See https://files.firstthingsfirst.org/regions/Publications/Regional%20Needs%20and%20Assets%20Report%20-%202018%20-%20Salt%20River%20Pima-Maricopa%20Indian%20Community.pdf
children (ages 0-17) have a median income that is less than one-third of the income in married couple families ($11,154 and $39,554, respectively).

Eligibility for some public assistance programs is determined by different poverty thresholds. For example, family income at or below 141 percent of the federal poverty threshold is one criterion for eligibility for the Arizona Health Care Cost Containment System (AHCCCS)ii for children ages 1 to 5, and at or below 147 percent of the federal poverty threshold for children under 1 year old. In the Salt River Pima-Marcopa Indian Community Region, the percentage of families with young children who may qualify for AHCCCS (those under 130% of FPL and between 130% and 149% of FPL) (77%) is higher than in all Arizona reservations combined (67%) and substantially higher than across the state (38%).

The Salt River Pima-Marcopa Indian Community manages its own tribal Temporary Assistance for Needy Families (TANF) program, known as Life Enhancement and Resource Network (LEARN). From 2015 to 2018, the number of young children receiving LEARN benefits decreased from 123 to 81. In 2018, an estimated 13 percent of young children in the region participated in the LEARN program. The number of families receiving Supplemental Nutrition Assistance Program (SNAP) benefits also declined slightly in the Salt River Pima-Marcopa Indian Community Region between 2015 and 2018, while the number of young children receiving SNAP benefits in the region increased slightly during the same time period. The proportion of young children participating in SNAP in 2018 was much higher in the region (75%) than in Maricopa County (39%) and Arizona (42%). Between school year 2015-2016 and school year 2017-2018, about two-thirds of students in the Salt River Pima-Marcopap Indian Community Region qualified for free or reduced-price lunches. This proportion increased in school year 2018-2019, when 92 percent of students were eligible. The Community Eligibility Provision, which began in 2018-2019 school year, allows the Salt River Pima-Marcopap Indian Community Region to offer free breakfast and lunch to all students regardless of their eligibility.

Fifty-nine percent of young children in the Salt River Pima-Marcopap Indian Community Region live in families with at least one parent in the labor force, compared to 67 percent in all Arizona reservations combined, and 89 percent in the state. The proportion of children in the region who live with only one parent and such parent is not in the labor force is higher in the region compared to all Arizona reservations (41% and 31%, respectively).

The average unemployment rate in the region for the 2013-2017 period was 19 percent, slightly lower than the estimated 21 percent in all Arizona reservations combined, but almost three times the average state rate of seven percent.

---

ii AHCCCS is Arizona’s Medicaid agency
Twenty-nine percent of households in the region spend 30 percent or more of their income on housing-related costs. This proportion is almost twice that in all Arizona reservations (16%) but comparable to Maricopa County (32%) and the state (31%).

Almost half (47%) of households in the region have both a smartphone and computer, which is higher than in all Arizona reservations (30%) but notably lower than the state of Arizona (67%). In addition, a higher proportion of residents in the Salt River Pima-Maricopa Indian Community Region live in households with a computer and internet-connectivity compared to all Arizona reservations (63% vs 38%). In both of these geographies, however, the proportion of people with a computer and internet-connectivity at home is lower than in the state (82%). Similarly, the percentage of children (ages 0-17) living in households with a computer and internet-connectivity for the region (63%) is higher than in all Arizona reservations (41%) but lower than the state overall. Of people living in households with a computer and internet in the region, 18 percent rely solely on a cellular data plan.

**Educational Indicators**

Children residing in the Salt River Pima-Maricopa Indian Community attend school at the Salt River Pima-Maricopa Indian Community Schools, the Mesa Unified School District (which serves the SRPMIC), a variety of other nearby public schools, charter schools, private schools or Bureau of Indian Education boarding schools. The Salt River Schools/Education Division included the Early Childhood Education Center, Salt River Elementary School, Salt River High School, and the Salt River Accelerated Learning Academy. Salt River High School closed on June 30, 2020.

According to the First Things First Salt River Pima-Maricopa Indian Community 2018 Needs and Assets Report, in school year 2014-2015, 31 percent of third graders at Salt River Elementary School attained passing scores on the math portion of the required Arizona’s Measurement of Educational Readiness to Inform Teaching (AzMERIT) assessment. The region’s passing percentage was lower than that across Arizona as a whole (42%). The 2018 Needs and Assets Report also notes that 29 percent of students demonstrated proficiency on the English Language Arts (ELA) AzMERIT test, compared to 40 percent across the state.

There are two high schools within the boundaries of the Salt River Pima-Maricopa Indian Community Region: Salt River High School and Salt River Accelerated Learning Academy, an alternative school. Both are charter schools operated by the Salt River Pima-Maricopa Indian Community. In 2017, the combined four-year graduation rate for students in these schools was 43 percent; the five-year graduation rate that year was 60 percent. From 2015 to 2017, the
The four-year graduation rate remained somewhat stable, while the five-year rate increased from 51 to 60 percent. The combined 7th-12th grade dropout rate for the two schools in the region decreased from 16 percent in 2015-2016, to 12 percent in 2016-2017, and increased to 13 percent the next school year.

Recent estimates from the American Community Survey show that proportion of adults (25 and older) who have more than a high-school education is higher in the Salt River Pima-Maricopa Indian Community Region (43%) than in all Arizona reservations combined (38%). Similar proportions of adults in both the region and all Arizona reservations have less than high-school education (25% and 26%, respectively). In 2017, 57 percent of the 100 births in the region were to mothers who had a high school diploma or higher educational attainment.

**Early Learning**

Early childhood education and care services for families in the Salt River Pima-Maricopa Indian Community Region are available through the Early Childhood Education Center (ECEC), the Family and Child Education (FACE) Program at Salt River Elementary, and the Early Enrichment Program under the Community’s Youth Services Department.

The tribally-operated Early Childhood Education Center (ECEC) offers several program options that allow parents to choose the one that best meets their individual needs. These include the Head Start preschool program, Early Head Start infant-toddler program and Early Childhood Education Center (Child Care Development Fund (CCDF) and tribally-funded component). Funding from CCDF is also used in the region to offer off-reservation child care services through the Certificate Program. This program covers a portion of the cost of child care services for families enrolled in federally recognized tribes living in the Salt River Pima-Maricopa Indian Community designated service area (i.e. Mesa, Tempe, Scottsdale, Phoenix, Glendale or the Salt River Pima-Maricopa Indian Community). This program serves children ages 6-weeks old to twelve years old and cost is based on a sliding-scale fee.

The Family and Child Education (FACE) program at Salt River Elementary is an early childhood and parental involvement program for American Indian families in schools sponsored by the Bureau of Indian Education that includes a center-based and a home-based component. The home-based component offers educational visits and screenings by parent educators and is aimed at families with children from birth to age three, although families can join the program from pregnancy on. The center-based preschool component includes an early childhood education program for children aged three to five, adult education for the children’s parents, and Parent and Child Time.

Center-based early care and education services in the region are also available through the Early Enrichment Program, which is housed at the Salt River Pima-Maricopa Indian Community.
Youth Services Department. This program, which is fully funded by the Salt River Pima-Maricopa Indian Community, provides free-of-cost services to preschool age children (3 to up to the time they enter kindergarten). The total enrollment capacity for the Early Enrichment Program is limited.

All of these early care and education programs in the Salt River Pima-Maricopa Indian Community Region have a combined capacity to serve approximately 485 children birth to age 5. Early childhood education enrollment rates in the Salt River Pima-Maricopa Indian Community Region are high. Forty percent of children ages three to four are enrolled in school (i.e. nursery school, preschool, or kindergarten) compared to 41 percent in all Arizona reservations.

In addition to the child care subsidies provided by the ECEC, some families in the Salt River Pima-Maricopa Indian Community Region also receive subsidies from the Arizona Department of Economic Security (DES). The number of young children receiving DES subsidies in the region declined slightly from 19 in 2015, to 13 in 2018. Other children receiving DES child care subsidies in the region are those involved with the state’s child welfare system through the Department of Child Safety (DCS). The proportion of young children who received this benefit in the region from 2015 to 2018 fluctuated from a high of 88 percent in 2016 and 2017, to a low of 74 percent in 2018. Between 2015 and 2018, the proportion of eligible families not using DES child care subsidies in the region remained stable at about 18 percent each year.

In State Fiscal Year 2019, there were no child care providers in the Salt River Pima-Maricopa Indian Community participating in Quality First.

The Department of Economic Security (DES) defines early care and education "quality environments" as providers that are accredited by a national organization or providers that have received a state-approved quality indicator that is recognized by the department. In 2017 and 2018 a similar number of young children from the region receiving child care subsidies from DES were served in quality environment settings, as defined by DES (14 and 15 children, respectively).

The number of children (ages 3-5) enrolled in special education in the Salt River Pima-Maricopa Indian Community Region fluctuated each school year from 2015-2016 to 2018-2019. During this last year, 20 young children were enrolled in special education. Three-quarters (75%) of these children were diagnosed with a developmental delay. In Fiscal Year 2016, between 17 and 33 children (ages 0-2) were referred to the Arizona Early Intervention Program (AzEIP) and

---

iii Providers are considered quality educational environments by the Arizona Department of Economic Security if they receive a Quality First three-star rating or higher or are accredited by a national organization, such as the Association for Early Learning Leaders or the National Association for the Education of Young Children (NAEYC).
were found eligible for services. The following Fiscal Year, between 24 and 32 children were referred and found eligible for AzEIP services. The number of cumulative active AzEIP cases in the region decreased from 21 in 2017, to 15 in 2018. Ten children (ages 0-2) from the Salt River Pima-Maricopa Indian Community Region were served by the Division of Developmental Disabilities (DDD) in Fiscal Year 2015, and fewer than ten children in this age range were served in the following three Fiscal Years. Fewer than ten children aged 3-5-years in the region received services from DDD in Fiscal Year 2015 and no children in this age range were served by DDD in the three Fiscal Years thereafter.

**Child Health**

In the Salt River Pima-Maricopa Indian Community Region, over one in four (27%) people lack health insurance coverage, a proportion that is higher than in all Arizona reservations (22%) and across the state of Arizona (12%). A similar pattern was seen in the percentage of young children without health insurance for the region, all Arizona reservations, and the state overall. It is also important to note that the U.S. Census Bureau does not consider coverage by the Indian Health Service (IHS) to be insurance coverage. In 2017, the most recent year for which data are available, AHCCCS (Arizona’s Medicaid program) paid for 69 percent of the 100 births in the region, while IHS paid for 14 percent.

A high proportion of births in the Salt River Pima-Maricopa Indian Community Region in 2017 were to mothers who did not have adequate prenatal care. Over one-third (38%) of births were to mothers who had no prenatal care in their first trimester, a percentage that is substantially higher than the Healthy People 2020 target of not more than 22.1 percent. Similarly, almost one-quarter (23%) of births were to mothers who had fewer than five prenatal visits, compared to six percent in Maricopa County and eight percent in the state. However, in 2017, the Salt River Pima-Maricopa Indian Community Region met the Healthy People 2020 target of no more than 7.8 percent of births being low birthweight (7.0%). In contrast, almost one in six (15%) births in the region were preterm births (i.e. less than 37 weeks), exceeding the Healthy People 2020 target of no more than 9.4 percent.

In school year 2018-2019, vaccination rates among kindergarteners in the Salt River Pima-Maricopa Indian Community Region were high and met all Healthy People 2020 targets. Personal belief exemptions from immunizations among kindergarteners in the region fluctuated between 2016-2017 and 2018-2019, with 1.6 percent of kindergarteners receiving personal belief exemptions in school year 2018-2019.

From 2015 to 2018 there were 14 non-fatal inpatient hospitalizations of young children for unintentional injuries from the Salt River Pima-Maricopa Indian Community Region. Between 2015 and 2017, there were 11 inpatient hospitalizations and 38 emergency room visits for
asthma among young children. In addition, between the years 2015 and 2018, there were 465 non-fatal emergency room visits for unintentional injuries for young children in the region. Falls (44%) and natural or environment (19%) were the most common reasons for these emergency room visits.

From 2015 to 2017 there were eight child deaths in the Salt River Pima-Maricopa Indian Community Region.

**Family Support and Literacy**

According to the First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council 2018 Needs and Assets Report, family involvement activities are available in the Community through the various early learning programs in the region. The Early Enrichment Program puts a strong emphasis on parent participation and involvement. Parents of children in the program are encouraged to participate in program activities at any time, and monthly family activities are part of the regular curriculum. At the Early Childhood Education Center, the Family Services team is composed of a Family Services Coordinator, a Family Involvement Specialist, two Parent Educators, and five Family Advocates. Each Advocate works with an average of 50 families and the caseload for Parent Educators is ten families each, with about 44 home visits per year per family. In addition, First Things First provides grant funds for parenting seminars through the Parent Outreach and Awareness Strategy. This strategy provides 124 parenting workshops through the SRPMIC Education Division. The Tribal Social Services Department also offers parent education services. Programs offered include a 10-week parenting course, and a 6-week Advanced Parent Training which began in the fall of 2015 with more focused topics aimed at supporting more practical skills such as setting boundaries. The Life Enhancement and Resource network houses the Fatherhood program, an intensive 6-month program, as well as Healthy Relationships classes

Child welfare services in the Salt River Pima-Maricopa Indian Community Region are provided by the Tribal Social Services Department, Tribal Child Protective Services (CPS) and the Family Advocacy Center. The First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council 2018 Needs and Assets Report indicates that in 2014 and 2015, 711 youth (ages 0-17) became wards of the Salt River Pima-Maricopa Indian Community. Those children were most frequently placed in foster homes, (40% in 2014; 53% in 2015) or with relatives (32% 2014; 27% 2015). The 2018 report also notes that tribal CPS removals had been decreasing since 2012, from a high of 144 to a low of 51 in 2015. Data specific to young children (ages 0-5) from the 2018 Needs and Assets Report show a decrease in the number of tribal CPS removals for that age group from 42 in 2014, to 26 in 2015. There was an increase in the number of available foster care beds from 2014 to 2015, with 14 on-reservation beds available in 2014 and
18 on and off-reservation beds available in 2015. The total number of foster care homes available remained at less than 10 during both years.

**Systems Coordination among Early Childhood Programs and Services**

The Salt River Pima-Maricopa Indian Community Region is becoming more aware of the need for focused efforts on coordination and collaboration among Tribal departments to increase awareness of and access to services for families. There are two key collaborative efforts taking place in the Salt River Pima-Maricopa Indian Community.

Within the past five years, the Tribe received a grant through the Inter-Tribal Council of Arizona to focus on enhancing collaboration and community clinical linkages between health and human services departments in the region. A committee was developed, led by the Tribe’s Health and Human Services Department, with service providers convening to promote collaboration and partnerships to provide more efficient services to families and help reduce silos and duplication of services in the Community. The First Things First Regional Partnership Council has begun cross-collaboration meetings among programs providing services to families with young children in the region. These bi-monthly meetings provide an opportunity for departments to share information on their programs and services, discuss opportunities for collaboration, and share information on upcoming events taking place in their departments. The regional council’s plan is to continue development of this effort to help foster consistent collaboration among programs for families with young children in the region.

**Communication, Public Information and Awareness**

First Things First regularly measures their progress toward building support for children birth to 5 through statewide surveys targeting both the general population and parents of young children. Their most recent statewide survey conducted in September 2018 found that, compared to previous surveys in 2012 and 2016, there was increased agreement in the general public and parents of young children with statements about the importance of early childhood health and development. These include: the state should ensure all children have access to early childhood services, a child who received early education and healthcare services before age 5 is more likely to succeed in school and beyond, and the state should put the same priority on early education as it does on K-12 education. While the survey also showed that awareness of First Things First has increased over time, there are still large portions of the general public (87%) and parents of young children (66%) who have never heard of First Things First.

In SFY 2019, First Things First secured 11 million advertising impressions through traditional media strategies, including television, radio, cinema, and billboard ads, and 76 million digital advertising impressions through digital media strategies, including online ads on desktop and smartphone devices. Particular success has been seen in the growth of Facebook Page Likes for
FTF, which grew from just 3,000 in 2012 to 142,600 in 2019. Additional digital marketing content in 2019 included 40 original, high-quality digital marketing pieces and the creation of an online searchable database of early childhood programs, which logged over 24,187 visits in its first six months.

First Things First has also led a concerted effort to build awareness among policymakers at all levels (federal, tribal, state, and municipal) of the importance of early childhood. In SFY19, FTF also launched ACT4KIDS, a text-based system that alerts participants to timely developments in early childhood policy and opportunities to engage with policymakers. In its first nine months of implementation, more than 700 Arizonans had signed up to participate in ACT4KIDS. In addition, FTF actively participates in the Arizona Early Childhood Alliance, comprised of more than 50 early childhood system leaders, which represents a united voice of the early childhood community in advocating for early childhood programs and services. For the past three years, the Alliance has also led an annual Early Childhood Day at the legislature, which draws hundreds of Arizonans to the state Capitol to engage with policymakers and show their support for early childhood development and health.
The Salt River Pima-Maricopa Indian Community Region

Regional Boundaries

The First Things First regional boundaries were established to create regions that (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments, (d) facilitate the ability to convene a Regional Partnership Council, and (e) allow for the collection of demographic and indicator data.

The boundaries of the First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council are those of the Salt River Reservation. When First Things First was established by the passage of Proposition 203 in November 2006, the government-to-government relationship with federally-recognized tribes was acknowledged. Each tribe with tribal lands located in Arizona was given the opportunity to participate within a First Things First designated region or elect to be designated as a separate region. The Salt River Pima-Maricopa Indian Community Region was one of 10 Tribes that chose to be designated as its own region. This decision must be ratified every two years, and the Salt River Pima-Maricopa Indian Community has opted to continue to be designated as its own region.

The Salt River Pima-Maricopa Indian Community is a sovereign tribe located in the metropolitan Phoenix area. The Community was established by Executive Order on June 14, 1878, and it consists of 52,600 acres bordering the cities of Scottsdale, Tempe, Mesa, and Fountain Hills. The Salt River Pima-Maricopa Indian Community is home to the Pima (‘Akimel O’Odham,’ River People) and the Maricopa (‘Xalychidom Pipaash,’ People who live toward the water).

Figure 1 shows the geographical area covered by the Salt River Pima-Maricopa Indian Community Region. Additional information available at the end of this report includes a map of the region by zip code in Appendix 1, a table listing zip codes for the region Appendix 2, and a map of school districts in the region in Appendix 3.
Figure 1. The First Things First Salt River Pima-Maricopa Indian Community Region

Custom map by the Community Research, Evaluation, & Development (CRED) Team using shapefiles obtained from First Things First and the U.S. Census Bureau 2019 TIGER/Line Shapefiles (https://www.census.gov/cgi-bin/geo/shapefiles/index.php).

Data Sources

The data contained in this report come from a variety of sources. Some data were provided to First Things First by state agencies, such as the Arizona Department of Economic Security (DES), the Arizona Department of Education (ADE), and the Arizona Department of Health Services (ADHS). Other data were obtained from publicly available sources, including the 2010 U.S. Census, the American Community Survey (ACS), and the Arizona Department of Administration (ADOA). Where more recent data are not available, this report cites data from the 2018 First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council Needs and Assets Report.

The U.S. Census\(^1\) is an enumeration of the population of the United States. It is conducted every ten years, and includes information about housing, race, and ethnicity. The 2010 U.S. Census data are available by census block. There are about 115,000 inhabited blocks in Arizona, with an average population of 56 people each. Census data presented in the report is drawn from the Census Geography for the Salt River Reservation.
The American Community Survey\(^2\) is a survey conducted by the U.S. Census Bureau each month by mail, telephone, and face-to-face interviews. It covers many different topics, including income, language, education, employment, and housing. The ACS data are available by census tract. Arizona is divided into about 1,500 census tracts, with an average of about 4,200 people in each. The ACS data are available for the Salt River Reservation Census Geography. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2013 to 2017. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates or estimates for small tribal communities.

These data sources are important for the unique information they are able to provide about children and families across the United States, but both of them have acknowledged limitations for their use on tribal lands. Although the Census Bureau asserted that the 2010 Census count was quite accurate in general, they estimate that “American Indians and Alaska Natives living on reservations were undercounted by 4.9 percent.” \(^3\) According to the State of Indian Country Arizona report\(^4\) there are particular challenges in using and interpreting ACS data from tribal communities and American Indians in general. There is no major outreach effort to familiarize the population with the survey (as is the case with the decennial census). Most important, the small sample size of the ACS makes it more likely that the survey may not accurately represent the characteristics of the population on a reservation. The State of Indian Country Arizona report indicates that at the National level, in 2010 the ACS failed to account for 14% of the American Indian/Alaska Native (alone, not in combination with other races) population that was actually counted in the 2010 decennial census. In Arizona the undercount was smaller (4%), but according to the State of Indian Country Arizona report, ACS may be particularly unreliable for the smaller reservations in the state.

While recognizing that estimates provided by ACS data may not be fully reliable, this report includes these estimates because they still are the most comprehensive publicly-available data that can help begin to describe the families that First Things First serve.

To protect the confidentiality of program participants, the First Things First Data Dissemination and Suppression Guidelines preclude our reporting social service and early education programming data if the count is less than ten and preclude our reporting data related to health or developmental delay if the count is less than six. In addition, some data received from state agencies may be suppressed according to their own guidelines. The Arizona Department of Health Services does not report counts less than six; the Arizona Department of Economic Security does not report counts between one and nine; and the Arizona Department of Education does not report counts less than eleven. Throughout this report, information which is not available because of suppression guidelines will be indicated by entries of “\(<6\)” or “\(<10\)” or
“<11” for counts, or “DS” (data suppressed) for percentages. Data are sometimes not available for particular regions, either because a particular program did not operate in the region or because data are only available at the county level. Cases where data are not available will be indicated by an entry of “N/A.”

For some data, an exact number was not available because it was the sum of several numbers provided by a state agency, and some numbers were suppressed in accordance with agency guidelines. In these cases, a range of possible numbers is provided, where the true number lies within that range. For example, for data from the sum of a suppressed number of children ages 0-12 months, 13 children ages 13-24 months, and 12 children ages 25-35 months, the entry in the table would read “26 to 34.” This is because the suppressed number of children ages 0-12 months is between one and nine, so the possible range of values is the sum of the two known numbers plus one to the sum of the two known numbers plus nine. Ranges that include numbers below the suppression threshold of less than six or ten may still be included if the upper limit of the range is above six or ten. Since a range is provided rather than an exact number, the confidentiality of program participants is preserved.

In most of the tables in this report, the top row of data corresponds to the First Things First Salt River Pima-Maricopa Indian Community Region. When available, the next rows show data that are useful for comparison purposes: all Arizona reservations combined, Maricopa County, and the state of Arizona. Please note that data are not always available for all of these geographies. Data labelled “All Arizona Reservations” come from either the 2010 U.S. Census or the 2013-2017 American Community Survey. These numbers are the totals for all residents of the 21 American Indian Areas within the state of Arizona. We include only the Arizona parts of the five reservations (Colorado River Indian Tribes, Fort Mojave, Fort Yuma, Navajo Nation, and Zuni) which have land in neighboring states.
Population Characteristics

Why it Matters

To support the healthy development and learning of young children across Arizona, advocates and decision makers need to understand who those children and their families are. Although parents are a child’s first and most important teachers, families of young children often use community resources to help them promote positive outcomes for their children. The number and characteristics of young children and families in a region can inform the range of services in a community, helping to guide where to locate child care, health care, and social services so that they are accessible to those who need them. Tribal communities are often located in rural locations and often experience different economic conditions within the state such as access to jobs, food resources, schools, health care facilities and providers, and social services. These disparities have been associated with a number of poor outcomes for children including infant mortality and obesity, among others.

Language use. Households with multiple languages spoken pose a unique balance of benefits for child learning and barriers to parental engagement, which counties with high rates of other languages spoken should specifically consider. Acknowledging and valuing linguistic heritage (such as through language preservation efforts) and recognizing needs for resources and services in languages other than English should remain important considerations for organizations and agencies across Arizona. Awareness of the levels of English proficiency and of other home languages spoken within a region provides information about a community’s assets and allows for identifying relevant supports. Young children can benefit from exposure to multiple languages; mastery of more than one language is an asset in school readiness and academic achievement, and offers cognitive and social-emotional benefits in early school and throughout their lifetime. Although dual language learning is an asset, limited English speaking households (that is, households where none of the adult members speak English well) can face challenges. These families may experience barriers to accessing health care and social service information, as well as barriers to engaging in important parent-teacher interactions, all of which can impede their child’s health and development. Providing information about resources and services in languages accessible to families in the region can help remove those barriers. Although Spanish is the most common second language spoken, Arizona is also home to a large number of Native communities, with Native languages spoken by families in those communities. Language preservation and revitalization are critical to strengthening culture in Native communities, addressing issues of educational equity, and to the promotion of social unity, community well-being, and Indigenous self-determination.
Special consideration should be given to respecting and supporting the numerous Native American languages spoken, particularly in tribal communities around the state.

**Family and household composition.** In addition to growing racial, ethnic and social diversity, U.S. and Arizona families are becoming more diverse in terms of family structure.$^{22,23,24,25}$ Understanding the makeup of families in a region can help better prepare child care, school and agency staff to engage with families in ways that support positive interactions both within families and with staff to enhance each child’s early learning and development.$^{26}$

Multi-generational households, particularly those where grandparents live in the home with the child and parents, are common in some communities and cultures and can provide financial and social benefits.$^{27}$ The proportion of young children living in a grandparent’s household in all Arizona reservations combined (40%) is more than double that of the state rate (14%).$^{28}$ It is important to note that these households may be multigenerational—i.e., the grandparent and the child’s parent may live in the same household.$^iv$ However, parents are not always in the picture in these homes. Care of children by someone other than their parents, such as relatives or close friends, is known as kinship care and is increasingly common.$^{29}$ Children living in kinship care can also arrive in those situations for a variety of reasons, including a parent’s absence for work or military service, chronic illness, drug abuse, or incarceration, or due to abuse, neglect, or homelessness. Understanding who is caring for children can help in identifying and creating specific supports for these families. Children in kinship care often face special needs as a result of trauma, and therefore these families often require additional support and assistance to help children adjust and provide the best possible home environment.$^{30}$ A child’s risk of living in poverty is also higher for those living with grandparents, adding to the family stress.$^{31}$ These families are likely to require access to information on resources, support services, benefits, and policies available to aid in their caregiving role.$^{32}$ Though it varies from one Native community to another, extended, multigenerational families, and kinship care are common in Native communities.$^{33,34}$ The strengths associated with this family structure—mutual help and respect—can provide members of these families with a network of support which can be very valuable when dealing with socio-economic hardships.$^{35}$ Grandparents are often central to these multigenerational households, in many cases sharing and strengthening Native language, history, and culture.$^{36,37}$

---

$^iv$ Note that there is difference between families/sub-families and householders in Census data. For example, a child living with their single mother in their grandparent’s married household would be counted as living with a single parent in the living arrangements but as living in a married couple household in the composition of households table. That is, the living arrangements figure looks at the presence of a child’s parents within the household (whether or not the parent is the householder).
What the Data Tell Us

Population, Race, and Ethnicity

- According to the 2010 U.S. Census, the total population of the Salt River Pima-Maricopa Indian Community Region was 6,289, of whom 626 were children ages birth to five years. About one in five (17%) of the 380 households in the region had one or more children ages birth to 5 years. The proportion of households with young children is lower in the region than in all Arizona reservations combined (26%) but is similar to Maricopa County (17%) (Table 1).
- The number of births per year in the region remained relatively constant from 2013 to 2017, with 100 births in calendar year 2017 (Figure 2).
- The majority of young children in the Salt River Pima-Maricopa Indian Community Region (91%) are American Indian. This proportion is similar to that in all Arizona reservations combined (92%) but substantially higher than across the state (6%). In addition, one in five young children in the region (20%) are Hispanic, a proportion that is higher than in all Arizona reservations combined (9%) (Table 3).
- Similarly, over half of adults in the region identify as American Indian (57%), while in Arizona only four percent of adult residents identify that way. This proportion, however, is notably lower than that in all Arizona reservations combined (88%) (Table 4).
  According to the First Things First Salt River Pima-Maricopa Indian Community 2018 Needs and Assets Report, the reason behind this difference is that the Community has two long-term leases for two trailer parks located in District C (“Roadrunner” and “Shadow Mountain”), where most of the residents (72%) are not American Indian: they are winter residents, some of whom are Canadian citizens.38 One of the leases ended on August 5, 2019 and there are no remaining residents at the Roadrunner Trailer Park. The second long-term lease for “Shadow Mountain” ends in 2026. These changes in land leases may result in an increase in the proportion of residents in the region identifying as American Indian in future reports.39
- The majority of births in the region in 2017 were to mothers who identify as American Indian (82%) (Table 5).
- Seven percent of young children (ages 0-5) in the Salt River Pima-Maricopa Indian Community region live with one or two foreign-born parents, more than twice that in all Arizona reservations combined (3%) (Table 6).

Language Use

- Eight percent of individuals ages five or older in the region speak a language other than English or Spanish at home. This proportion is lower than that in all Arizona reservations combined (50%), but similar to the state rate (6%) (Table 7).
• The Salt River Pima-Maricopa Indian Community Region has a high English-language proficiency. Three percent of the population five and older speak another language at home and do not speak English “very well.” Similarly, only three percent of the households in the region are considered “limited English speaking,” compared to 12 percent in all Arizona reservations combined (Table 8 & Table 9).

Family and Household Composition

• A higher proportion of young children in the Salt River Pima-Maricopa Indian Community Region live in households with two parents or two step-parents compared to children in all Arizona reservations combined (33% vs 27%). Fourteen percent of young children in the region live with relatives who are not their parents, also a higher proportion than in all Arizona reservations combined (8%) (Table 10).
• Thirty-seven percent of young children (ages 0-5) in the region live in a grandparent’s household (Table 12).
• Of the 515 children (ages 0-17) living in a grandparent’s household, close to half (47%) live with a grandparent who is responsible for them (Table 13).

Economic Circumstances

Why it Matters

A family’s economic stability is a powerful predictor of child well-being and is one of the key social determinants of health.\(^{40}\) Factors contributing to economic stability – or lack thereof – include poverty, food insecurity, employment, and housing instability.\(^{41}\)

Economic circumstances in tribal communities can be much more complex than in other parts of the state. For many historical and legal reasons, economic development in tribal areas has followed a different trajectory than in other areas. Economic disparities between non-Native and Native communities have compounded over decades, affecting the poverty, employment, housing instability and food security in tribal areas.\(^{42}\) At the same time, it is common for tribal governments to be involved in community and economic development, investing in forestry, fisheries, gaming, and many other economic arenas to strengthen the social and economic conditions of their people.\(^{43}\)

**Poverty.** Childhood poverty can negatively affect the way children’s bodies grow and develop, including fundamental changes to the architecture of the brain.\(^{44}\) Children raised in poverty are at a greater risk of a host of negative outcomes including low birth weight, lower school achievement, and poor health.\(^{45,46,47,48,49}\) They are also more likely to remain poor later in life.\(^{50,51}\) As a benchmark, the 2019 Federal Poverty Guideline – the criterion used for establishing eligibility for some safety net programs – for a family of four was $25,750.\(^{52}\) However the federal poverty guideline definition of poverty was developed in the 1950s, and estimates only what a family would need to earn to afford basic nutrition, without taking into account other costs of living;\(^{53}\) it is widely considered to be well below what a family actually needs to earn to make ends meet.\(^{54}\) The “self-sufficiency standard” attempts to estimate how much families need to earn to fully support themselves, accounting for local costs of housing, transportation, and childcare, and other budget items.\(^{55}\) The 2018 self-sufficiency standard for an Arizona family with two adults, one preschooler, and one school-age child was $56,143 – over twice the poverty threshold.\(^{56}\)

Public assistance programs are one way of counteracting the effects of poverty and providing supports to children and families in need. The Temporary Assistance for Needy Families (TANF) Cash Assistance program provides temporary cash benefits and support services to children and families. Eligibility is based on citizenship or qualified resident status, Arizona residency, and limits on resources and monthly income. In recognition of tribal sovereignty, federally-recognized tribes have the option to administer their own TANF program.
The Salt River Pima-Maricopa Indian Community is one of the six Arizona tribes that operate a Tribal TANF program. Since tribes set their own priorities for their communities and many design their own social services, some Tribal TANF program requirements may differ from those in state programs (e.g. time limit on receipt of TANF cash assistance). Tribal TANF programs also have more flexibility in determining program requirements to meet the needs of their own communities. With a focus on self-sufficiency, tribal TANF programs can include community and social programs that are unique to their spiritual and cultural traditions.57

**Food insecurity.** A limited or uncertain availability of food is negatively associated with many markers of health and well-being for children, including heightened risks for developmental delays,58 and overweight and obesity.59 The USDA defines food deserts as areas that are low-income and have low access to sources of healthy food, specifically grocery stores and supermarkets.v60 A large portion of tribal lands in Arizona are in food deserts, adding to food insecurity in tribal communities.61 Sixty-five percent of populated tribal lands are considered food deserts, whereas only 17 percent of all populated areas in Arizona meet the definition of a food desert.62 To help reduce food insecurity, there are a variety of federally-funded programs including the Supplemental Nutrition Assistance Program (SNAP),63 the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC),64 the National School Lunch Program,65 the School Breakfast Program,66 the Summer Food Service Program,67 and the Child and Adult Care Food Program (CACFP).68 However, only about 58 percent of food insecure households nationwide report participating in federally-funded nutrition assistance programs.69 Income-eligible American Indians residing on some reservations in Arizona may have access to the federal Food Distribution Program on Indian Reservations (FDPIR).70 On rural Indian reservations, the FDPIR exists to distribute food to eligible Native residents who do not have access to SNAP offices or SNAP-approved businesses.71

**SNAP.** Administered by the Arizona Department of Economic Security and also referred to as “Nutrition Assistance” and “food stamps,” SNAP has been shown to help reduce hunger and improve access to healthier food.72 SNAP benefits support working families whose incomes simply do not provide for all their needs. For low-income working families, the additional funds available to access food from SNAP can help make a meaningful difference. For example, for a three-person family with one person who earns a minimum wage, SNAP benefits can boost take-home income by 10-20 percent.73

**WIC.** Administered by the Arizona Department of Health Services, this federally-funded program serves pregnant, postpartum, and breastfeeding women, as well as infants and young children (under the age of five) who are economically disadvantaged (i.e., family incomes at or

---

5 Low access is defined differently for urban (within ½-1 mile) and rural areas (within 10-20 miles).
below 185 percent of the federal poverty level). The program offers funds for nutritious food, breastfeeding and nutrition education, and referrals to health and social services. Participation in WIC has been shown to be associated with healthier births, lower infant mortality, improved nutrition, decreased food insecurity, improved access to health care, and improved cognitive development and academic achievement for children.

**National School Lunch Program.** Administered by the Arizona Department of Education, the National School Lunch Program provides free and reduced-price meals at school for students whose family incomes are at or less than 130 percent of the federal poverty level for free lunch, and 185 percent of the federal poverty level for reduced price lunch.

**Employment.** Unemployment and underemployment can affect a family’s ability to meet the expenses of daily living, as well as their access to resources needed to support their children’s well-being and healthy development. A parent’s job loss can affect children’s school performance, leading to poorer attendance, lower test scores, and higher risk of grade repetition, suspension, or expulsion. Unemployment can also put families at greater risk for stress, family conflict, and homelessness. Note that this does not include persons who have dropped out of the labor force entirely, including those who wanted to but could not find suitable work and thus have stopped looking for employment. Due to many historical and legal reasons as well as differences in practical economic structures, employment rates in Native communities can vary greatly from state rates.

**Housing instability.** Examining indicators related to housing quality, costs, and availability can reveal additional factors affecting the health and well-being of young children and their families in a region. Housing challenges such as issues paying rent or mortgage, overcrowded living conditions, unstable housing arrangements, and homelessness can have harmful effects on the physical, social-emotional, and cognitive development of young children. Traditionally, housing has been deemed affordable for a family if it costs less than 30 percent of their annual income. High housing costs, relative to family income, are associated with increased risk for overcrowding, frequent moving, poor nutrition, declines in mental health, and homelessness. On tribal lands, even when housing is affordable, housing availability is typically lower due to the legal complexities of land ownership and the lack of rental properties. These circumstances often lead to a shortage of safe, quality housing.

One increasingly critical need for modern homes is a reliable means of internet access. Families often rely on communication and information technologies to access information, connect socially, pursue an education, and apply for employment opportunities. Parents are also more likely to turn to online resources, rather than in-person resources, for information about obtaining health care and sensitive parenting topics including bonding, separation anxiety, and managing parenting challenges. The term “digital divide” refers to disparities in
communication and information technologies, and the lack of sustained access to information and communication technologies in low-income communities is associated with economic and social inequality. Low-income households may experience regular disruptions to this increasingly important service when they cannot pay bills, repair or update equipment, or access public locations that may offer connectivity (e.g., computers at local libraries). Nationally, Americans are increasingly reliant on smartphones as their sole source of internet access. Particularly for individuals who are younger, lower-income, and non-white, broadband service at home is less common and smartphone-only internet use is more common. Households in rural areas typically experience more limited coverage from mobile networks and slower-speed internet services, as well as limited internet provider options which can result in higher monthly costs. This is especially true of the more rural Native American communities in the state, where broadband services are sometimes non-existent.
What the Data Tell Us

Poverty

- Sixty-one percent of young children (ages 0-5) in the Salt River Pima-Maricopa Indian Community Region live in poverty. This rate is higher than that of young children in all Arizona reservations combined (54%) and substantially higher than the state (26%). The poverty rate for young children in the region is also notably higher than the rate for the region’s population as a whole (28%) (Figure 3).

- The median income for all families in the region is $38,903, much lower than in Maricopa County ($69,647), and the state of Arizona ($63,812). Single female-headed families with children (ages 0-17) have a median income that is less than one-third of the income in married couple families ($11,154 and $39,554, respectively) (Table 14).

- Eligibility for some public assistance programs is determined by different poverty thresholds. For example, family income at or below 141 percent of the federal poverty threshold is one criterion for eligibility for the Arizona Health Care Cost Containment System (AHCCCS) vi for children ages 1 to 5, and at or below 147 percent of the federal poverty threshold for children under 1 year old. 95 In the Salt River Pima-Maricopa Indian Community Region, the percentage of families with young children who may qualify for AHCCCS (those under 130% of FPL and between 130% and 149% of FPL) (77%) is higher than in all Arizona reservations combined (67%) and substantially higher than across the state (38%) (Table 15 and Figure 4).

- The Salt River Pima-Maricopa Indian Community manages its own tribal Temporary Assistance for Needy Families (TANF) program, known as Life Enhancement and Resource Network (LEARN). In State Fiscal Year 2018, between 39 and 47 families with young children participated in the LEARN program (Table 16).

- From 2015 to 2018, the number of young children receiving LEARN benefits decreased from 123 to 81. In 2018, an estimated 13 percent of young children in the region participated in the LEARN program (Table 17).

Food Insecurity

- The number of families receiving Supplemental Nutrition Assistance Program (SNAP) benefits declined slightly in the Salt River Pima-Maricopa Indian Community Region between 2015 and 2018, while the number of young children receiving SNAP benefits in the region increased slightly during the same time period. The proportion of young

---

vi AHCCCS is Arizona’s Medicaid agency
children participating in SNAP in 2018 was much higher in the region (75%) than in Maricopa County (39%) and Arizona (42%) (Table 18 & Table 19)

- Between school year 2015-2016 and school year 2017-2018, about two-thirds of students in the Salt River Pima-Maricopa Indian Community Region qualified for free or reduced-price lunches. This proportion increased in school year 2018-2019, when 92 percent of students were eligible (Table 20). The Community Eligibility Provision, which began in 2018-2019 school year, allows Salt River Pima-Maricopa Indian Community Region to offer free breakfast and lunch to all students regardless of their eligibility.96

Employment

- Fifty-nine percent of young children in the Salt River Pima-Maricopa Indian Community Region live in families with at least one parent in the labor force, compared to 67 percent in all Arizona reservations combined, and 89 percent in the state. The proportion of children in the region who live with only one parent and such parent is not in the labor force is higher in the region compared to all Arizona reservations (41% and 31%, respectively) (Table 21).
- The average unemployment rate in the region for the 2013-2017 period was 19 percent, slightly lower than the estimated 21 percent in all Arizona reservations combined, but almost three times the average state rate of seven percent (Table 22).

Housing Instability

- Twenty-nine percent of households in the region spend 30 percent or more of their income on housing-related costs. This rate is almost twice as that in all Arizona reservations (16%) but comparable to Maricopa County (32%) and the state (31%) (Table 23).
- Almost half (47%) of households in the region have both a smartphone and computer, which is higher than in all Arizona reservations (30%) but still notably lower than the state of Arizona (67%) (Table 24).
- A notably higher proportion of residents in the Salt River Pima-Maricopa Indian Community Region live in households with a computer and internet connectivity compared to all Arizona reservations (63% vs 38%). In both of these geographies, however, the proportion of people with a computer and internet connectivity at home is lower than in the state (82%) (Table 25).
• Similarly, the percentage of children (ages 0-17) living in households with a computer and internet connectivity for the region (63%) is higher than in all Arizona reservations (41%), but lower than the state overall (Table 26).

• Of people living in households with a computer and internet in the region, 18 percent rely solely on a cellular data plan (Table 27).

Note: The labor force includes all persons who are currently employed, including those on leave, furlough, or temporarily laid off. Persons who are unemployed but actively looking for work are also considered to be in the labor force. Persons who are not working or looking for work (e.g., retired persons, stay-at-home parents, students) are considered to be “not in the labor force” in the American Community Survey.

Educational Indicators

Why it Matters

Measures of educational engagement and achievement in a community have important implications for the developmental and economic resources available to children and families in that region. Individuals with higher levels of education tend to live longer and healthier lives.97 Indicators such as school attendance and absenteeism, achievement on standardized testing, high school graduation rates, and adult educational attainment can provide valuable information about a region’s educational engagement and success. Early learning can set the stage for future educational achievement, and is discussed more fully in the following section.

School attendance and absenteeism. School attendance and academic engagement early in life can significantly impact the direction of a child’s schooling trajectory. Chronic absenteeism is defined as missing more than 10 percent of the school days within a school year, and it affects even the youngest children, with more than 10 percent of U.S. kindergarteners and first graders considered chronically absent.98 Poor school attendance can cause children to fall behind, leading to lower proficiency in reading and math and increased risk of not being promoted to the next grade.99 Consistent school attendance is particularly important for children from economically disadvantaged backgrounds, the group of children most at risk for chronic absenteeism.100,101

Achievement on standardized testing. A child’s third-grade reading comprehension skills have been identified as a critical indicator of future academic success.102 Students who are at or above grade level reading in third grade are more likely to go on to graduate high school and attend college.103 The link between poor reading skills and risk of dropping out of high school is even stronger for children living in poverty. More than a quarter (26%) of children who were living in poverty and not reading proficiently in third grade did not finish high school. This is more than six times the high school dropout rate of proficient readers.104

In 2010, the Arizona legislature, recognizing the importance of early identification and targeted intervention for struggling readers, enacted Move on When Reading legislation. As of 2015, the statewide assessment tool for English language arts (ELA), including reading and writing, is Arizona’s Measurement of Education Readiness to Inform Teaching (AzMERIT).vii,105 AzMERIT scores are used to determine promotion from the third grade in accordance with the Move on When Reading policy. Move on When Reading legislation states that a student shall not be promoted to fourth grade if their reading score falls far below the third-grade level, as

---

vii AzMERIT was renamed AzM2, a change that will take effect during the 2019-2020 school year.
established by the State Board of Education. Exceptions exist for students identified with or being evaluated for learning disabilities and/or reading impairments, English language learners, and those who have demonstrated reading proficiency on alternate forms of assessment approved by the State Board of Education.

**Graduation rates and adult educational attainment.** Ultimately, adult educational attainment speaks to the assets and challenges of a community’s workforce, including those who are working with or on behalf of young children and their families. Adults who have graduated from high school have better health and financial stability, lower risk for incarceration, and better socio-emotional outcomes compared to adults who dropped out of high school.107,108 Children whose parents have higher levels of education are more likely to have positive outcomes related to school readiness and educational achievement, promoting academic success across generations.109 Given the cascading effect of early education on later academic achievement and success in adulthood, it is critical to provide substantial support for early education and promote policies and programs that encourage the persistence and success of Arizona’s children.
What the Data Tell Us

Achievement on Standardized Testing

- Children residing in the Salt River Pima-Maricopa Indian Community attend school at the Salt River Pima-Maricopa Indian Community Schools, the Mesa Unified School District (which serves the SRPMIC), a variety of other nearby public schools, charter schools, private schools or Bureau of Indian Education boarding schools. The Salt River Schools/Education Division included the Early Childhood Education Center, Salt River Elementary School, Salt River High School, and the Salt River Accelerated Learning Academy. Salt River High School closed on June 30, 2020.110
- The 2018 Needs and Assets Report also notes that performance on the English Language Arts (ELA) 29 percent of students demonstrated proficiency on the AzMERIT test, compared to 40 percent across the state (Figure 5).
- According to the First Things First Salt River Pima-Maricopa Indian Community 2018 Needs and Assets Report, in school year 2014-2015 31 percent of third graders at Salt River Elementary School attained passing scores on the math portion of the required statewide AzMERIT assessment. The region’s passing rate was lower than that across Arizona as a whole (42%) (Figure 6).

Graduation Rates and Adult Educational Attainment

- There are two high schools within the boundaries of the Salt River Pima-Maricopa Indian Community Region: Salt River High School and Salt River Accelerated Learning Academy, an alternative school. Both are charter schools operated by the Salt River Pima-Maricopa Indian Community.111 In 2017, the combined four-year graduation rate for students in these schools was 43 percent; the five-year graduation rate that year was 60 percent (Table 28). From 2015 to 2017, the four-year graduation rate remained somewhat stable, while the five-year rate increased from 51 to 60 percent (Table 29 and Table 30).
- The combined 7th-12th grade dropout rate for the two schools in the region decreased from 16 percent in 2015-2016, to 12 percent in 2016-2017, and increased to 13 percent the next school year (Table 31).
- Recent estimates from the American Community Survey show that proportion of adults (25 and older) who have more than a high-school education is higher in the Salt River Pima-Maricopa Indian Community Region (43%) than in all Arizona reservations combined (38 %). Similar proportions of adults in both the region and all Arizona reservations have less than high-school education (25% and 26%, respectively) (Figure 7).
- In 2017, 57 percent of the 100 births in the region were to mothers who had a high school diploma or higher educational attainment (Table 32).

Early Learning

Why it Matters

Early childhood is an exciting time of rapid physical, cognitive, and social-emotional development. The experiences young children have during these early years are critical for healthy brain development and set the stage for lifelong learning and well-being. Just as rich, stimulating environments can promote development, early negative experiences can have lasting effects. For example, gaps in language development between children from disadvantaged backgrounds and their more advantaged peers can be seen by 18 months of age; those disparities that persist until kindergarten tend to predict later academic problems.

Access to early care and education. Though high-quality early care and education can promote development, families often face barriers in accessing these opportunities for their children. Families living in rural areas are more likely to face an inadequate child care supply, but Arizona families in both urban and rural areas face a gap between the number of young children and the availability of licensed child care. In fact, Arizona has a deficit of about 22,230 licensed early care and education slots to meet the needs of working families, without accounting for parents continuing their own education, or those not in the workforce but seeking out early learning programs to help assure their preschool age children are able to make a strong start in school. Even when early education is available, the cost can be prohibitive. According to the U.S. Department of Education, only 19 percent of four-year-olds in Arizona are enrolled in publicly-funded free or reduced cost preschool programs, compared to 41 percent nationally. If not enrolled in publicly-funded programs, the annual cost of full-time center-based care for a young child in Arizona is nearly equal to the cost of a year at a public college.

Child care subsidies can be a support for families who have financial barriers to accessing early learning services. In June 2019, for the first time since the Great Recession, the Arizona Department of Economic Security’s (DES) child care subsidy waiting list was suspended, meaning all children who qualify for subsidies are able to receive them, assuming that they are able to find a provider. This is due to $56 million in additional federal funds from the Child Care and Development Fund (CCDF) that was authorized by the State Legislature, and the funding increase has also allowed DES to increase provider reimbursement rates, which may make it easier for families to use their child care subsidies.

High quality early care and education. In addition to the early experiences children have in their homes, high quality early care and education services can also promote physical,
cognitive, and social-emotional development and health, particularly for children from
disadvantaged backgrounds. Children whose education begins in high quality preschool
programs repeat grades less frequently, obtain higher scores on standardized tests, experience
fewer behavior problems, and are more likely to graduate from high school. This translates
into a return on investment to society through increased educational achievement and
employment, reductions in crime, and better overall health of children as they mature into
adults. Not only does access to affordable, quality child care make a positive difference for
children’s health and development, it also allows parents to maintain stable employment and
support their families. The early care education system in tribal communities often consists
of a complex network of center-based and home-based care and education settings with
funding from varied sources including tribal governments, federal grants, and the Arizona
Department of Education.

Establishing that available early care and education programs meet quality standards is
important to ensure these early environments support positive outcomes for children’s well-
being, academic achievement, and success later in life. Providers are considered quality
educational environments by the Arizona Department of Economic Security if they receive a
Quality First three-star rating or higher (see below) or are accredited by a national organization,
such as the Association for Early Learning Leaders or the National Association for the Education
of Young Children (NAEYC).

High quality early education environments have teachers with more education, experience, and
supports that increase their skills in developing positive teacher-child interactions, providing
enriching age-appropriate experiences and guiding appropriate behaviors. These quality
environments may be particularly important for children with challenging behaviors, because
lower teacher-child ratios and access to professional development and early childhood mental
health consultation can help avoid preschool expulsion.

Quality First is Arizona’s Quality Improvement and Rating System (QIRS) for early child care and
preschool providers. A Quality First Star Rating represents where along the continuum of
quality (1 to 5 stars) a program was rated and how they are implementing early childhood best
practices. One star indicates a program is participating in Quality First, is regulated, in good
standing, and is making the commitment to work on quality improvement. Three stars indicate
that a program is of good quality care, and families can be confident that children are well
cared for in such an environment. Five stars indicate the highest level of quality attainable,
where families will find low staff-child ratios and group sizes, highly educated personnel, and
strong curriculum which optimizes children’s comprehensive development. The number of
providers across the state that meet quality standards (three-star rating or higher) has
increased across the last 5 years such that 25 percent of the 857 participating providers in 2013
met or exceeded quality standards, and 76 percent of 1,032 participating providers in 2019 met or exceeded quality standards.142

High quality early care and education practices, including lower teacher-child ratios, access to professional development, and early childhood mental health consultation, can help avoid preschool expulsion.143,144 Nationally, preschool expulsions and suspensions occur at high rates and disproportionately impact children of color, specifically young Black boys.145,146 In 2016, an estimated 50,000 preschoolers were suspended and 17,000 preschoolers expelled nationwide, with Black children 2.2 times more likely to be suspended or expelled than other children.147 The U.S. Department of Education Office of Civil Rights began collecting data on preschool suspension and expulsion in 2011 and, as a result of federal changes to the Child Care Development Block Grant in 2014, Arizona began collecting provider-reported data on early learning environment expulsion in 2017.148,149 Given the positive impact of early educational experiences on children’s cognitive and emotional development and the negative impact of suspension and expulsion on educational outcomes, it is essential to identify areas with higher rates of expulsion to provide targeted supports.150

As an alternative to expulsion, early education providers in Arizona have an opportunity to identify young children as being at risk for expulsion and to receive consultation from experts to help intervene in problem behaviors. Consultation is provided through on-site mental health consultation, available for Quality First and some non-Quality First providers in most but not all regions in the state, as well as through a statewide Department of Economic Security (DES)-managed hotline. If that child is then able to remain in the center, this is documented as a prevented expulsion and their case is closed out. The reported number of prevented expulsions of young children receiving subsidies increased from seven in 2017 to 45 in 2018.151

**Young children with special needs.** The availability of early learning opportunities and services for young children with special needs is an ongoing concern across the state, particularly in the more geographically remote communities and some tribal communities. Children with special health care needs are defined as “those who have or are at increased risk for a chronic physical, developmental, behavioral, or emotional condition and who also require health and related services of a type or amount beyond that required by children generally.”152 According to the National Survey of Children’s Health, children with special health care needs are more likely to experience more adverse childhood experiences (ACEs) than typically-developing children,153

---

**viii** ACEs include 8 categories of traumatic or stressful life events experienced before the age of 18 years. The 8 ACE categories are sexual abuse, physical abuse, emotional abuse, household adult mental illness, household substance abuse, domestic violence in the household, incarceration of a household member, and parental divorce or separation.
and are at an increased risk for maltreatment and neglect,\textsuperscript{154,155} suggesting they may particularly benefit from high quality teacher-child interactions in classrooms.\textsuperscript{156,157} Nationally, American Indian/Alaska Native children receive special education services at the highest rates (18\%) of any racial/ethnic group, with notably higher rates of services than their white (14\%) and Hispanic (13\%) peers.\textsuperscript{158} Almost half (46\%) of families with a child with special needs in Arizona have incomes below 200 percent of the federal poverty level, suggesting that even if they can identify an appropriate provider, affording quality care is likely to be a burden.\textsuperscript{159}

Ensuring all families have access to timely and appropriate screenings for children who may benefit from early identification of special needs can help improve outcomes for these children and their families. Timely intervention can help young children with, or at risk for, developmental delays improve language, cognitive, and socio-emotional development.\textsuperscript{160,161} It also reduces educational costs by decreasing the need for special education.\textsuperscript{162} In Arizona, services available to families with children with special needs include those provided through the Arizona Early Intervention Program (AzEIP),\textsuperscript{163} the Arizona Department of Education Early Childhood Special Education program,\textsuperscript{164} and the Division of Developmental Disabilities (DDD).\textsuperscript{165}
What the Data Tell Us

Access to Early Care and Education

- Early childhood education and care services for families in the Salt River Pima-Maricopa Indian Community Region are available through the Early Childhood Education Center (ECEC), the Family and Child Education (FACE) Program at Salt River Elementary, and the Early Enrichment Program under the Community’s Youth Services Department.

- The tribally-operated **Early Childhood Education Center (ECEC)** offers several program options that allow parents to choose the one that best meets their individual needs. These include the Head Start preschool program, Early Head Start infant-toddler program and Early Childhood Education Center (Child Care Development Fund (CCDF) and tribally-funded component). Although these different program components are available through the ECEC, the categories mostly refer to the funding source and the eligibility requirements associated with it. For the past 10 years, ECEC has been operating under a unique “blended” model where all enrolled children receive the same services in one facility, regardless of what specific funding source (or program) they are enrolled through. 166

- Funding from CCDF is also used in the region to offer off-reservation child care services through the **Certificate Program**. This program covers a portion of the cost of child care services for families enrolled in federally recognized tribes living in the Salt River Pima-Maricopa Indian Community designated service area (i.e. Mesa, Tempe, Scottsdale, Phoenix, Glendale or the Salt River Pima-Maricopa Indian Community). This program serves children ages 6-weeks old to twelve years old and cost is based on a sliding-scale fee.167

- The **Family and Child Education (FACE)** program at Salt River Elementary is an early childhood and parental involvement program for American Indian families in schools sponsored by the Bureau of Indian Education that includes a center-based and a home-based component. The home-based component offers educational visits and screenings by parent educators and is aimed at families with children from birth to age three, although families can join the program from pregnancy on. The center-based preschool component includes an early childhood education program for children aged three to five, adult education for the children’s parents, and Parent and Child Time.168

- Center-based early care and education services in the region are also available through the **Early Enrichment Program**, which is housed at the Salt River Pima-Maricopa Indian Community Youth Services Department. This program, which is fully funded by the Salt River Pima-Maricopa Indian Community, provides free-of-cost services to preschool age children (3 to up to the time they enter kindergarten).
The total enrollment capacity for the Early Enrichment Program is limited. This capacity is determined by the number that the program can provide transportation for (Table 33).

All of these early care and education programs in the Salt River Pima-Maricopa Indian Community Region have a combined capacity to serve approximately 485 children birth to age 5 (Table 33).

Early childhood education enrollment rates in the Salt River Pima-Maricopa Indian Community Region are high. Forty percent of children ages three to four are enrolled in school (i.e. nursery school, preschool, or kindergarten) compared to 41 percent in all Arizona reservations (Table 34).

Child care services in the Salt River Pima-Maricopa Indian Community Region are provided on a sliding-scale fee at the Early Childhood Education Center (ECEC). Other early learning programs in the Community are available free-of-cost such as the Early Enrichment and FACE programs. The billing structure for child care services before and after the Head Start hours is dependent upon the current year’s Federal Poverty Levels and the Arizona State Median Income levels which are updated annually. Some families living under the poverty guidelines are exempt from paying a co-payment and these families include children placed in protective care, including foster placement, homeless children, and children of teen parents who are attending high school.

In addition to the child care subsidies provided by the ECEC, some families in the Salt River Pima-Maricopa Indian Community Region also receive subsidies from the Arizona Department of Economic Security (DES). The number of young children receiving DES subsidies in the region declined slightly from 19 in 2015, to 13 in 2018 (Table 35).

Other children receiving DES child care subsidies in the region are those involved with the state’s child welfare system through the Department of Child Safety (DCS). The proportion of young children who received this benefit in the region from 2015 to 2018 fluctuated from a high of 88 percent in 2016 and 2017, to a low of 74 percent in 2018 (Table 36).

Between 2015 and 2018, the proportion of eligible families not using DES child care subsidies in the region remained stable at about 18 percent each year (Table 37).

High Quality Early Care and Education

In State Fiscal Year 2019, there were no child care providers in the Salt River Pima-Maricopa Indian Community participating in Quality First (Table 38 and Table 39).

The Department of Economic Security (DES) defines early care and education “quality environments” as providers that are accredited by a national organization or providers
that have received a state-approved quality indicator that is recognized by the department.\textsuperscript{ix} In 2017 and 2018 a similar number of young children from the region receiving child care subsidies from DES were served in quality environment settings, as defined by DES (14 and 15 children, respectively) (Table 40).

**Young Children with Special Needs**

- The number of children (ages 3-5) enrolled in special education in the Salt River Pima-Maricopa Indian Community Region fluctuated each school year from 2015-2016 to school year 2018-2019. During this last year, 20 young children were enrolled in special education (Table 41). Three-quarters (75\%) of these children were diagnosed with a developmental delay (Table 42).
- In Fiscal Year 2016, between 17 and 33 children (ages 0-2) were referred to the Arizona Early Intervention Program (AzEIP) and were found eligible for services. The following Fiscal Year, between 24 and 32 children were referred and found eligible for AzEIP services (Table 43).
- The number of cumulative active AzEIP cases in the region decreased from 21 in 2017, to 15 in 2018 (Table 44).
- Ten children (ages 0-2) from the Salt River Pima-Maricopa Indian Community Region were served by the Division of Developmental Disabilities (DDD) in Fiscal Year 2015. Fewer than ten children in this age range were served by DDD in the three Fiscal Years thereafter (Table 45).
- Fewer than ten children in the 3-5-year-old range received services from DDD in Fiscal Year 2015 in the region. There were no children in this age range being served by DDD in the region in the three Fiscal Years thereafter (Table 46).

\textsuperscript{ix} More information about Arizona’s quality educational environments can be found in the DES CCDF State Plan FY2019-FY2021, available at [https://des.az.gov/documents-center](https://des.az.gov/documents-center)

Child Health

Why it Matters

The physical and mental health of both children and their parents are important for optimal child development and well-being. Starting with the mother’s health before pregnancy, many factors influence a child’s health.\textsuperscript{171} Exposures and experiences in utero, at birth, and during the early years set the stage for health and well-being throughout a child’s life.\textsuperscript{172,173} Access to health insurance and preventive care influence not only a child’s current health, but long-term development and future health.\textsuperscript{174,175,176} Various health care services, depending on the region, are available to members of federally-recognized Indian tribes from Indian Health Service (IHS) facilities and/or other tribally-administered health care facilities.\textsuperscript{177,178}

Access to health services. The ability to obtain health care is critical for supporting the health of pregnant mothers and young children. Health care during pregnancy, or prenatal care, can reduce maternal and infant mortality and complications during pregnancy.\textsuperscript{179,180} In the early years of a child’s life, well-baby and well-child visits allow clinicians to assess and monitor the child’s development and offer developmentally appropriate information and guidance to parents.\textsuperscript{181} Families without health insurance are more likely to skip these visits, and are less likely to receive preventive care for their children, or care for health conditions and chronic diseases.\textsuperscript{182,183} Thus, access to health insurance is an indicator of children’s access to health services. Children who lack health insurance are also more likely to be hospitalized and to miss school.\textsuperscript{184} Despite being eligible to receive health care services through IHS facilities and/or tribally-operated facilities, Native communities often struggle to access adequate, high quality care. Services and funding are often limited at IHS facilities,\textsuperscript{185} and eligibility for IHS services alone does not meet the minimum essential coverage requirement under the Affordable Care Act.\textsuperscript{186} Transportation is a challenge in many rural tribal regions, which can also limit access to care. Close to one in 5 households on tribal lands do not have a vehicle available (17%), which is more than double the proportion of households without a vehicle statewide (7%).\textsuperscript{187}

Maternal, infant, and child health. A number of factors occurring before conception and in utero influence child health, making characteristics of pregnant women important determinants of the birth and developmental outcomes of their children. Pregnancy during the teen years is associated with a number of health concerns for infants, including neonatal death, sudden infant death syndrome, and child abuse and neglect.\textsuperscript{188} Teenaged mothers (and fathers) themselves are less likely to complete high school or college, and more likely to require public assistance and to live in poverty than their peers who are not parents.\textsuperscript{189,190,191}
In addition to age, a mother’s health status before, during, and after pregnancy influences her child’s health. Women who are obese before they become pregnant are at a higher risk of birth complications and neonatal and infant mortality than women who are normal weight before pregnancy. Babies born to obese women are at risk for chronic conditions later in life such as diabetes and heart disease. Preterm birth, in addition to being associated with higher infant and child mortality, often results in longer hospitalization, increased health care costs, and longer-term impacts such as physical and developmental impairments. Babies born at a low-birth weight (less than 5 pounds, 8 ounces) are also at increased risk of infant mortality and longer-term health problems such as diabetes, hypertension and cardiac disease.

Maternal mental health is a factor for children’s well-being as well. Maternal depression during and after pregnancy negatively influences the mother’s ability to maintain a healthy pregnancy as well as meet the demands of motherhood and form a secure attachment with her baby. Quality preconception counseling and early-onset prenatal care can help reduce some of these risks for poor prenatal and postnatal outcomes by providing information, conducting screenings, and supporting an expectant mother’s health and nutrition.

Substance use disorders. A mother’s use of substances such as drugs and alcohol also has implications for her baby. Babies born to mothers who smoke are more likely to be born early (pre-term), have low birth weight, die from sudden infant death syndrome (SIDS) and have weaker lungs than babies born to mothers who do not smoke. Opiate use during pregnancy, either illegal or prescribed, has been associated with neonatal abstinence syndrome (NAS), a group of conditions that causes infants exposed to these substances in the womb to be born exhibiting withdrawal symptoms. This can create longer hospital stays, increase health care costs and increase complications for infants born with NAS. Infants exposed to cannabis (marijuana) in utero often have lower birth weights and are more likely to be placed in neonatal intensive care compared to infants whose mothers had not used the drug during pregnancy.

Parental substance abuse also has significant impacts on family wellbeing. According to the National Survey of Children’s Health, young children in Arizona are more than twice as likely to live with someone with a problem with alcohol or drugs than children in the U.S. as a whole (9.8 percent compared to 4.5 percent). Children of parents with substance use disorders are more likely to be neglected or abused and face a higher risk of later mental health and behavioral health issues, including developing substance use disorders themselves. Substance abuse treatment and supports for parents and families grappling with these issues can help to ameliorate the short and long-term impacts on young children. Because of the impact of historical trauma and adverse childhood experiences (ACEs), in Native American communities, interventions to address substance use among youth and adults are often trauma-informed, culturally-grounded and community-based.
Nutrition and weight status. After birth, a number of factors have been associated with improved health outcomes for infants and young children. One factor is breastfeeding, which has been shown to reduce the risk of ear, respiratory and gastrointestinal infections, SIDS, overweight, and type 2 diabetes.\textsuperscript{208} The American Academy of Pediatrics recommends exclusive breastfeeding for about 6 months, and continuing to breastfeed as new foods are introduced for 1 year or longer.\textsuperscript{209} American Indians have the lowest breastfeeding rate nationwide. There is a movement to reclaim breastfeeding among Native women to benefit the health of the mother, child, and community. In one example of an effort to address this issue, the Indian Health Service (IHS) has been tasked to make all IHS birthing hospitals baby-friendly, which includes breastfeeding support as part of maternity care.\textsuperscript{210}

A child’s weight status can have long-term impacts on health and well-being. Nationwide, an estimated 3 percent of children ages 2-19 are underweight, 16.6 percent are overweight, and 18.5 percent are obese.\textsuperscript{211,212} Obesity can have negative consequences on physical, social, and psychological well-being that begin in childhood and continue into and throughout adulthood.\textsuperscript{213} Higher birth weight and higher infancy weight, as well as lower-socioeconomic status and low-quality mother-child relationships, have all been shown to be related to higher childhood weight and increased risk for obesity and metabolic syndrome (which is linked to an increase risk of heart disease, stroke, and diabetes).\textsuperscript{214,215}

Oral health. Oral health and good oral hygiene practices are important to children’s overall health. Tooth decay and early childhood cavities can have short- and long-term consequences including pain, poor appetite, disturbed sleep, lost school days, and reduced ability to learn and concentrate.\textsuperscript{216} A national study showed that low-income children were more likely than higher income children to have untreated cavities.\textsuperscript{217} Despite high percentages of young Arizona children who have preventative dental care visits (68.4%) compared to the national average (57.8%), there is a relatively high percentage who have had decayed teeth or cavities (11.1%) compared to those across the nation overall (7.7%).\textsuperscript{218} Low-income children in Arizona, specifically, are more likely to have untreated cavities and less likely to have had an annual dental visit than their higher-income peers.\textsuperscript{219} According to a 2015 study, among kindergarteners, American Indian children in Arizona had significantly higher incidences of decay (75% AIAN versus 52% all races), and untreated decay (48% AIAN versus 24% all races), relative to all kindergarteners.\textsuperscript{220}

First Things First's Oral Health strategy was able to provide 24,664 children birth to age 5 with a dental screening, and 16,837 children with a fluoride varnish in the Arizona State Fiscal Year 2019.\textsuperscript{221} Many children had untreated tooth decay and other oral health needs identified through the screenings. Further, attempts were made to connect children to dental homes who either did not already have a dental home or who needed dental care.
**Childhood immunizations.** Immunization against preventable diseases protects children and the surrounding community from illness and potentially death. In order to ensure community immunity of preventable diseases, which helps to protect unvaccinated children and adults, rates of vaccination in a community need to remain high.\(^{222}\)

**Illness and injury.** Asthma is the most common chronic illness affecting children\(^{223}\), and it is more prevalent among boys, Black children, American Indian or Alaska Native children, and children in low-income households.\(^{224,225}\) The total healthcare costs of childhood asthma in the United States are estimated to be between $1.4 billion and $6.4 billion, but these costs could be reduced through better management of asthma to prevent hospitalizations.\(^{226}\) Unintentional injuries are the leading cause of death for children in Arizona\(^{227}\) and nationwide.\(^{228}\) It is estimated that as many as ninety percent of unintentional injury-related deaths could be preventable through better safety practices, such as use of proper child restraints in vehicles and supervision of children around water.\(^{229}\) Children in rural areas are at higher risk of unintentional injuries than those who live in more urban areas, as are children in Native communities, suggesting that injury prevention is an especially salient need in these areas.\(^{230,231}\)

One useful metric for evaluating child health in Arizona are the Healthy People objectives. These science-based objectives define priorities for improving the nation’s health and are updated every 10 years. Understanding where Arizona mothers and children fall in relation to these current national benchmarks (Healthy People 2020) can help highlight areas of strength in relation to young children’s health and those in need of improvement in the state. The Arizona Department of Health Services monitors state level progress towards a number of maternal, infant and child health objectives for which data are available at the county level, including increasing the proportion of pregnant women who receive prenatal care in the first trimester; reducing low birth weight; reducing preterm births; and increasing abstinence from cigarette smoking among pregnant women.\(^{232}\)
What the Data Tell Us

Access to Health Services

- In the Salt River Pima-Maricopa Indian Community Region, over one in four (27%) people lack health insurance coverage, a percent that is higher than in all Arizona reservations (22%) and the state of Arizona (12%). A similar pattern was seen in the percentage of young children without health insurance for the region, all Arizona reservations, and the state overall (Table 47 and Figure 8). It is important to note that the U.S. Census Bureau does not consider coverage by the Indian Health Service (IHS) to be insurance coverage.

- In 2017, the most recent year for which data are available, AHCCCS (Arizona’s Medicaid program) paid for 69 percent of the 100 births in the region, while IHS paid for 14 percent of them (Table 48).

Maternal, Infant, and Child Health

- A high proportion of births in the Salt River Pima-Maricopa Indian Community Region in 2017 were to mothers who did not have adequate prenatal care. Over one-third (38%) of births were to mothers who had no prenatal care in their first trimester, a percentage that is substantially higher than the Healthy People 2020 target of not more than 22.1 percent. Similarly, almost one-quarter (23%) of births were to mothers who had fewer than five prenatal visits, compared to six percent in Maricopa County and eight percent in the state (Table 49).

- In 2017, the Salt River Pima-Maricopa Indian Community Region met the Healthy People 2020 target of no more than 7.8 percent of births being low birthweight (7.0%). However, almost one in six (15%) births in the region were preterm births (i.e. less than 37 weeks), exceeding the Healthy People 2020 target of no more than 9.4 percent (Table 50).

Child Immunizations

- In school year 2018-2019, vaccination rates among kindergarteners in the Salt River Pima-Maricopa Indian Community Region were high and met all Healthy People 2020 targets (Table 51).

- Personal belief exemptions from immunizations among kindergarteners in the region fluctuated between 2016-2017 and 2018-2019, with 1.6 percent of kindergarteners receiving personal belief exemptions in school year 2018-2019 (Table 52).
Illness and Injury

- From 2015 to 2018 there were 14 non-fatal inpatient hospitalizations of young children for unintentional injuries from the Salt River Pima-Maricopa Indian Community Region (Table 53).
- From 2015 to 2017 there were 11 inpatient hospitalizations and 38 emergency room visits for asthma among young children from the region (Table 54).
- From 2015 to 2018 there were 465 non-fatal emergency room visits for unintentional injuries for young children in the region. Falls (44%) and natural or environment (19%) were the most common reasons for these emergency room visits (Table 55).
- From 2015 to 2017 there were eight child deaths in the Salt River Pima-Maricopa Indian Community Region (Table 56).

Family Support and Literacy

Why it Matters

Families and caregivers play a critical role as their child’s first and most important teacher. Positive and responsive early relationships and interactions support optimal brain development during a child’s earliest years and lead to better social, physical, academic, and economic outcomes later in life.\textsuperscript{233,234,235,236} Parental and family involvement is positively linked to academic skills and literacy in preschool, kindergarten, and elementary school.\textsuperscript{237} Children benefit when their families have the knowledge, resources, and support to use positive parenting practices, and support their child’s healthy development, nutrition, early learning, and language acquisition. Specifically, knowledge of positive parenting practices and child development has been identified as one of five key protective factors that improve child outcomes and reduce the incidence of child abuse and neglect.\textsuperscript{x,238}

Early literacy. Parental and family involvement is positively linked to academic skills and literacy in preschool, kindergarten and elementary school.\textsuperscript{239} Early literacy promotion, through singing, telling stories, and reading together, is so central to a child’s development that the American Academy of Pediatrics has emphasized it as a key issue in primary pediatric care, aiming to make parents more aware of their important role in literacy.\textsuperscript{240} A child’s reading skills when entering elementary school have been shown to strongly predict academic performance in later grades, emphasizing the importance of early literacy for future academic success.\textsuperscript{241,242} Home-based literacy practices between parents and caregivers and young children, specifically, have been shown to improve children’s reading and comprehension, as well as children’s motivation to learn.\textsuperscript{243,244} However, low-income families may face additional barriers to home-based literacy practices, including limited free time with children, limited access to books at home, and a lack of knowledge of kindergarten readiness.\textsuperscript{245} Communities may employ many resources to support families in engaging with their children, including through targeted programs like home visitation programs and “stay and play” programs, or participating in larger initiatives like Read On Arizona or the national “Reach Out & Read” program.\textsuperscript{246}

\textsuperscript{x} The Center for the Study of Social Policy developed Strengthening Families: A Protective Factors Framework\textsuperscript{™} to define and promote quality practice for families. The research-based, evidence-informed Protective Factors are characteristics that have been shown to make positive outcomes more likely for young children and their families, and to reduce the likelihood of child abuse and neglect. Protective factors include: parental resilience, social connections, concrete supports, knowledge of parenting and child development, and social and emotional competence of children.
Arizona children’s reading scores are below the national average. Of all the students in Arizona, Native American students face the biggest need for improved literacy.247 The Bureau of Indian Education (BIE)’s Family and Child Education (FACE) program was developed to address some of the unique early literacy needs of American Indian children. The program includes training for staff at child care centers, parenting education and support, Native American language and cultural learning, and reading and learning practices for the family and child.248

**Adverse childhood experiences.** Unfortunately, not all children are able to begin their lives in positive, stable environments. Experiences early in life can have lasting impacts on an individual’s mental and physical health. Adverse Childhood Experiences (ACEs) have been linked to future risky health behaviors (such as smoking, drug use, and alcoholism), chronic health conditions (including diabetes, depression, and obesity), poorer life outcomes (such as lower educational achievement and increased lost work time), and early death.249 Alternatively, Positive Childhood Experiences (PCEs), including positive parent-child relationships and feelings of safety and support, have been shown to have similarly cumulative, though positive, long-term impacts on mental and relational health.250 Nationally and in Arizona, very young children are most at risk for child abuse, neglect, and fatalities from abuse and neglect. In 2017, children five years old and younger made up more than half (55%) of child maltreatment victims in Arizona.251 Future poor health outcomes are also more likely as an individual’s ACE score increases.252 Children in Arizona are considerably more likely to have experienced two or more ACEs (27.3%), compared to children across the country (8.3%).253 These children and their families may require specific, targeted resources and interventions in order to reduce harm and prevent future risk.254 In Native American communities, where historical trauma compounds the effects of ACEs, healing may take place through an integration of healthcare-based interventions (physical, behavioral, and mental health), and interventions that build on the strength of culture and community.255, 256, 257

**Mental and behavioral health.** Behavioral health supports, both for children and caregivers, are often needed to address exposure to adverse childhood events. Infant and toddler mental health development involves the young child’s developing capacity to “experience, regulate and express emotions; form close interpersonal relationships; and explore the environment and learn.”258 When young children experience stress and trauma they often suffer physical, psychological, and behavioral consequences and have limited responses available to react to those experiences. Understanding the behavioral health of mothers is also important for the well-being of Arizona’s young children. Mothers dealing with behavioral health issues such as depression may not be able to perform daily caregiving activities, form positive bonds with their children, or maintain relationships that serve as family supports.259
**Child removals and foster care.** There are situations where the harm in remaining with their family is determined to be too great to a child and they are removed from their home, either temporarily or permanently. Children involved in foster care systems often have physical and behavioral health issues, in addition to the social-emotional needs brought on by being removed from a parent’s care. Foster parents often need education, support and resources to ensure they are able to successfully care for foster children who may have these added health needs. According to a 2015 Arizona Department of Child Safety Independent Review, focusing on evidence-based targeted interventions for families at risk of child removal – including home visitation, positive parenting programs, and family-based therapy – may help lower this risk, thus reducing placements in the foster care system. In accordance with the Indian Child Welfare Act of 1978 (ICWA), many tribal governments manage their own child welfare systems and state systems must work cooperatively with them. ICWA established federal guidelines that are to be followed when an Indian child enters the welfare system in all state custody proceedings. Under ICWA, an Indian child’s family and tribe are able and encouraged to be actively involved in the decision-making that takes place regarding the child, and may petition for tribal jurisdiction over the custody case. ICWA also mandates that states make every effort to preserve Indian family units by providing family services before an Indian child is removed from his or her family, and after an Indian child is removed through family reunification efforts.
What the Data Tell Us

Family Involvement

- According to the First Things First Salt River Pima-Maricopa Indian Community Regional Partnership Council 2018 Needs and Assets Report, family involvement activities are available in the Community through the various early learning programs in the region.
  - The Early Enrichment Program puts a strong emphasis on parent participation and involvement. Parents of children in the program are encouraged to participate in program activities at any time, and monthly family activities are part of the regular curriculum. Parent participation is typically very good, and most parents (and often also extended family members) take part in the events organized by the program.
  - At the Early Childhood Education Center, the Family Services team is composed of a Family Services Coordinator, a Family Involvement Specialist, two Parent Educators, and five Family Advocates. Each Advocate works with an average of 50 families, and has approximately two contacts per family per month. The caseload for Parent Educators is ten families each, with about 44 home visits per year per family.
  - First Things First provides grant funds for parenting seminars through the Parent Outreach and Awareness Strategy. This strategy provides 124 parenting workshops through the SRPMIC Education Division.
  - The Tribal Social Services Department also offers parent education services. Programs offered include a 10-week parenting course, and a 6-week Advanced Parent Training which began in the fall of 2015 with more focused topics aimed at supporting more practical skills such as setting boundaries. The Life Enhancement and Resource network houses the Fatherhood program, an intensive 6-month program, as well as Healthy Relationships classes.264
Systems Coordination among Early Childhood Programs and Services

Why it Matters

From November 2016 to June 2017, First Things First convened the second Arizona Early Childhood Task Force, comprised of diverse leaders from across the state. The goal of the task force was to create an ambitious, yet attainable, statewide five-year plan for First Things First and Arizona’s early childhood system. Building from the model early-childhood system developed in 2010, the task force identified six desired outcomes, one of which is “When the early childhood system is successful, everyone will benefit from living in communities where the early childhood system is high-quality, centered on children and families, coordinated, integrated and comprehensive.” First Things First’s role in building this system is to foster cross-system collaboration among local, state, federal, and tribal organizations to improve the coordination and integration of programs, services, and resources for young children and their families.

Through system building, First Things First connects various components of the early childhood system to create a more holistic system that promotes shared results for children and families. Agencies that work together are often easier for families to access, and the services they provide are more responsive to those families’ needs. Coordination efforts may also increase agencies’ capacity to deliver services by identifying and addressing gaps in the service delivery continuum. By supporting a variety of coordination efforts, First Things First aims to create a high quality, interconnected, and comprehensive system of early-childhood service delivery that enhances children’s overall development and that is timely, culturally responsive, family driven, and community based. Determining how these efforts are affecting each of the 28 regions and their families can help inform services, programs, and policy decisions to benefit families and young children throughout the state.
What the Data Tell Us

The Salt River Pima-Maricopa Indian Community Region is becoming more aware of the need for focused efforts on coordination and collaboration among Tribal departments to increase awareness of and access to services for families. There are two key collaborative efforts taking place in the Salt River Pima-Maricopa Indian Community.

Within the past five years, the Tribe received a grant through the Inter-Tribal Council of Arizona to focus on enhancing collaboration and community clinical linkages between health and human services departments in the region. A committee was developed, led by the Tribe’s Health and Human Services Department, with service providers convening to promote collaboration and partnerships to provide more efficient services to families and help reduce silos and duplication of services in the Community. The First Things First Regional Partnership Council has begun cross-collaboration meetings among programs providing services to families with young children in the region. These bi-monthly meetings provide an opportunity for departments to share information on their programs and services, discuss opportunities for collaboration, and share information on upcoming events taking place in their departments. The regional council’s plan is to continue development of this effort to help foster consistent collaboration among programs for families with young children in the region.
Communication, Public Information and Awareness

Why it Matters

Public awareness of the importance of early childhood development and health is critical in building a comprehensive, effective early childhood system in Arizona. Building public awareness and support for early childhood impacts individual behaviors as well as the broader objectives of system building. For the general public, information and awareness is the first step in taking positive action in support of children birth to 5. This could include a range of actions—from influencing their personal networks by sharing early childhood information to actively encouraging community leaders to support programs and services for young children. For parents and other caregivers, awareness is the first step to engaging in programs or behaviors that will better support their child’s health and development.

There is no single communications strategy that will achieve the goal of making early childhood an issue that more Arizonans value and prioritize. Therefore, integrated strategies that complement and build on each other are key to any successful strategic communications effort. Employing a range of communications strategies to share information—from traditional broad-based tactics such as paid media advertising to grassroots, community-based tactics such as community outreach—ensures that diverse audiences are reached more effectively across multiple media platforms. A thoughtful and disciplined combination of methods of delivering information is required to ensure multiple messaging touch-points for diverse audiences: families, civic organizations, faith communities, businesses, local leaders, and others.
What the Data Tell Us

Since State Fiscal Year 2011, First Things First (FTF) has led a collaborative, concerted effort to build public awareness and support across Arizona employing integrated communications strategies that now include:

- strategic messaging and branding
- community outreach
- community awareness
- social media
- digital content marketing
- earned media
- paid media advertising

Progress toward building support for children birth to age 5 can be measured by changes in awareness, attitudes and behaviors, as demonstrated through key results of a periodic statewide survey and through tactical impact measures. The most recent statewide survey was held in September 2018. Key results of this statewide survey – which was comprised of both a general phone survey and an online survey of parents of young children specifically – included the following:

- Those who agree that the state should ensure all children have access to early childhood services increased from 80% in 2012 to 84% in 2018.
  - Among parents, this measure increased from 81% in 2016 (the first available parent survey results) to 87% in 2018.
- Those who agree that a child who received early education and healthcare services before age 5 is more likely to succeed in school and beyond increased from 82% in 2012 to 88% in 2018.
  - Among parents, agreement increased from 85% in 2016 to 87% in 2018.
- Those who agree that the state should put the same priority on early education as it does on K-12 education increased from 62% in 2012 to 72% in 2018.
  - Among parents, agreement increased from 69% in 2016 to 74% in 2018.

While understanding and supporting early childhood in general is critical, it’s also important that Arizonans have a trustworthy source of early childhood resources and know about the availability of early childhood resources, programs and tools. For this reason, building awareness of FTF as a credible source is critical. Results of the most recent statewide survey
show that, while some progress has been made, there is still more to be done to increase awareness about FTF.

- In the 2018 general survey, **87% of respondents had never heard of FTF**, compared to 89% in 2012.
  - Among parents specifically, more had heard of FTF, with **66% stating they had never heard of FTF**, compared to 69% in 2016.

While this statewide survey offers a measure of broad changes in attitude and awareness, specific tactical measures of awareness and support-building strategies employed by FTF offer another point of information. These include:

- FTF implemented three annual statewide awareness campaigns since the last regional needs and assets reporting period. The SFY17-SFY18 campaign - Help Them Get There - shared messaging about the importance of the early years to future school and life success and that parents’ everyday positive interactions with babies, toddlers and preschoolers promote healthy development. The SFY19 campaign – Givers of Care – focused specifically on the important role of caregivers and quality early learning environments.

- These paid campaigns reached a large number of Arizonans, measured through the total number of impressions, which directly impacts awareness. Traditional media impressions refer to television, radio, cinema and billboard ads while digital media impressions refer to online ads which appear on both desktop and smartphone devices. These statewide impressions – which measure the estimated number of views of FTF ads – are detailed below.

- In addition, targeted digital advertising allows geographically-based targeting of audiences within regions with the ability to measure the number of click-throughs that digital ads garnered. The click-throughs delivered viewers to the FTF website. In SFY19,
digital advertising led to a statewide total of 521,652 clicks-throughs to the FTF website where families could access more information and resources.

- In the area of social media, engagement with FTF early childhood online platforms has grown over the years. Particular success has been seen in the growth of Facebook Page Likes for FTF, which grew from just 3,000 in 2012 to 142,600 in 2019. Content is also distributed through Twitter, LinkedIn and Instagram.

- Since inception in SFY17, FTF’s digital content marketing strategy which targets parents and families with engaging and informative video and blog posts via website, social media and email has expanded its reach. In SFY19, 40 original, high-quality content pieces were published.

- In SFY19, an online searchable database of early childhood programs funded by FTF in all the regions launched. In the first six months, over 24,187 visits were logged.

Engaging others is critical to reaching across diverse geographic areas and expanding the reach of early childhood information. FTF specifically works to engage parents’ most trusted messengers, including pediatricians. In SFY19, FTF created a toolkit for health providers to help them better understand and share information on the statewide free Birth to 5 Helpline. This toolkit was distributed to attendees of the annual conference of the Arizona Chapter of the American Academy of Pediatrics. Other statewide awareness partnerships included creation and distribution of a grocery list tip pad for parents and caregivers sharing Read On Arizona’s Smart Talk tips, a digital content sharing partnership with Expect More Arizona and partnering with the Arizona Association for the Education of Young Children on a social media campaign promoting Week of the Young Child.

First Things First has also led a concerted effort to build awareness among policymakers at all levels (federal, tribal, state and municipal) of the importance of early childhood. This includes: in-office meetings with elected leaders to provide general information on early childhood, as well as discuss the impact of proposed legislation; regular communication to policymakers with updates on early childhood research and the work of FTF (such as a quarterly email newsletter.
for policymakers and their staff); and site tours of FTF-funded programs to allow policymakers to see the impact of early childhood investments in their area. In SFY19, FTF also launched ACT4KIDS, a text-based system that alerts participants to timely developments in early childhood policy and opportunities to engage with policymakers. In its first nine months of implementation, more than 700 Arizonans had signed up to participate in ACT4KIDS.

In addition, FTF actively participates in the Arizona Early Childhood Alliance – comprised of more than 50 early childhood system leaders like the United Ways, the state affiliates of the National Association for the Education of Young Children, Southwest Human Development, Children’s Action Alliance, Read On Arizona, Stand for Children, Expect More Arizona and the Helios Foundation – represent the united voice of the early childhood community in advocating for early childhood programs and services. For the past three years, the Alliance has also led an annual Early Childhood Day at the Legislature, which have drawn hundreds of Arizonans to the state Capitol to engage with policymakers and show their support for early childhood development and health.

177 As a result of the Indian Self-Determination and Education Assistance Act (PL-93-638) (ISDEAA), federally recognized tribes have the option to receive the funds that the Indian Health Service (IHS) would have used to provide health care services to their members. The tribes can then utilize these funds to directly provide services to tribal members. This process is often known as 638 contracts or compacts.
