INTRODUCTION

Ninety percent of a child's brain growth occurs before kindergarten and the quality of a child's early experiences impacts whether their brain will develop in positive ways that promote learning. First Things First (FTF) was created by Arizonans to help ensure that Arizona children have the opportunity to start kindergarten prepared to be successful. Understanding the critical role the early years play in a child's future success is crucial to our ability to foster each child's optimal development and in turn, impact all aspects of well-being in our communities and our state.

This Needs and Assets Report for the Yuma Region helps us in understanding the needs of young children, the resources available to meet those needs and gaps that may exist in those resources. An overview of this information is provided in the Executive Summary and documented in further detail in the full report.

The report is organized by topic areas pertinent to young children in the region, such as population characteristics or educational indicators. Within each topic area are sections that set the context for why the data found in the topic areas are important (Why it Matters), followed by a section that includes available data on the topic (What the Data Tell Us).

The FTF Yuma Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options when it comes to supporting the healthy development and education of young children in their care. It is our sincere hope that this information will help guide community conversations about how we can best support school readiness for all children in the Yuma Region. To that end, this information may be useful to local stakeholders as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to age 5 in communities throughout the region.

ACKNOWLEDGEMENTS

The Yuma Regional Partnership Council wishes to thank all of the federal, state and local partners whose contributions of data, ongoing support and partnership with First Things First (FTF) made this report possible. These partners included the Arizona Departments of Administration (Employment and Population Statistics), Child Safety, Economic Security, Education and Health Services; Child Care Resource and Referral; and the U.S. Census Bureau. We are especially grateful for the spirit of collaboration exhibited by all our partners as we, as a state, continue to recover from the COVID-19 pandemic.

We also want to thank parents and caregivers, local service providers and members of the public who attended regional council meetings and voiced their opinions, as well as all the organizations working to transform the vision of the regional council into concrete programs and services for children and families in the Yuma Region.

Lastly, we want to acknowledge the current and past members of the FTF Yuma Regional Partnership Council whose vision, dedication and passion have been instrumental in improving outcomes for young children and families within the region. As we build upon those successes, we move ever closer to our ultimate goal of creating a comprehensive early childhood system that ensures children throughout Arizona are ready for school and set for life.

EXECUTIVE SUMMARY

The Yuma Region. The First Things First (FTF) Yuma Region lies in the southwest corner of Arizona, bordering Mexico and California. The Yuma Region has the same boundaries as Yuma County minus the Cocopah Indian Tribe reservation lands (which are included in the FTF Cocopah Tribe Region). The region does include the Arizona portion of the land belonging to the Fort Yuma Quechan Indian Tribe.

Population Characteristics. According to the U.S. Census, the Yuma Region had a population of 203,024 in 2020, a 4% increase from 2010 when 194,934 people resided in the region. Conversely, the population of young children birth to age 5 decreased 15% over the same period from 17,983 in 2010 to 15,249 in 2020. The increase in the total population in the region (4%) was lower than that seen across the state which experienced a 12% increase in the total population from 2010 to 2020. The decrease in the population of young children of 15% in the region was higher than the 12% decrease seen across the state during those years. Fewer than one in five households (17%) in the region included a young child in 2020, a higher proportion of households than across the state (13%). The 2020 Census undercount of young children i appears more pronounced in the Yuma Region than that seen across the state, as the number of live births in the region between 2015 and 2020 (n=17,832) is higher than the number of young children birth to age 5 in the 2020 Census (n=15,249) by a difference of +17%. Across the state, a +1% difference is seen comparing the same indicators.

Most Yuma Region residents identify as Hispanic or Latino (64% of all age population, 79% of children birth to age 4), higher proportions than the population of young children (44%) and all ages (31%) identifying as Hispanic or Latino across the state. The Yuma Region has a lower proportion of the total population and children birth to age 4 identified as Non-Hispanic White (32% and 19%, respectively), Black or African American (3% and 4%), American Indian (3% for both), or Asian or Pacific Islander (2% and 3%) than the state across those categories. The proportion of the total population and young child population identified as Multiracial in the region (26% and 31%, respectively) were higher than those proportions across the state (14% and 21%, respectively).

Thirty-six percent of children birth to age 5 in the region live with foreign-born parents, a higher proportion than across the state overall (24%). Household language use also reflects these demographic patterns; a much larger proportion of individuals speak Spanish at home in the Yuma Region (53%) compared to across Arizona (20%). Of those who speak a language other than English at home, a larger proportion of individuals do not speak English "very well" in the region (20%) compared to the state (8%). Similarly, the percentage of limited-English-speaking households in the region (11%) is almost three times that of the state (4%).

The number of English Language Learners (ELL) increased slightly in the Yuma Region between the 2020-21 and 2021-22 school years, with 7,780 ELL students enrolled in preschool through 12th grade in

-

ⁱ See "2020 Census data and its limitations" at the beginning of the Population Characteristics section for fuller context on the 2020 Census undercount of young children.

the region in the 2021-22 school year. This represents 20% of students enrolled in all grades in the region that school year. Across Arizona, 8% of students in all grades were ELL students in both the 2020-21 and 2021-22 school years.

More than half of young children in the Yuma Region live in two-parent households; 51% live with two married parents or stepparents, which is lower than Arizona overall (59%). More young children in the region (45%) live in a household with one parent compared to the state (37%). Seventeen percent of children birth to age 5 in the region live in their grandparent's household, higher than the proportion of young children in those living situations across the state (13%). Of grandparents who live with and are responsible for their grandchildren under age 18 in the Yuma Region, most are female (60%), similar to the proportion across the state (62%) and do not speak English very well (61%), a much higher proportion than across Arizona as a whole (21%). Almost half (48%) of these grandparents in the region are in the labor force, and almost three in 10 (28%) have an income below the poverty level. Three in 10 (30%) do not have the child's parent in the household, just below the proportion across Arizona (33%). Overall, in the region, 10% of grandparents have grandchildren under age 18 in their household with no parent present, similar to the proportion across the state (11%).

Economic Circumstances. Median family income for families in Yuma County is lower than for families in Arizona across all household types. The median income for married couple families with children in Yuma County (\$72,500) is lower than married couple families across Arizona (\$100,000), and this income is more than double the median income for single-male-headed families (\$34,100) and nearly triple that of single-female-headed families (\$25,900) in Yuma County.

According to 2017-2021 American Community Survey (ACS) estimates, rates of poverty in the region for the entire population (18%) and for children birth to age 5 (26%) are higher than those across the state (13% and 20%, respectively). Rates of poverty for young children have decreased since 2012-2016 ACS estimates across the state (2012-2016, 28%; 2017-2021, 20%) whereas in the region these rates have changed little during the same period (2012-2016, 27%; 2017-2021, 26%). Over half of young children in the Yuma Region (53%) live below 185% of the federal poverty level (FPL), a higher proportion than across the state (39%). Even this relatively higher category of income for a family of four (185% FPL = \$50,836) falls below the self-sufficiency standard for two parents with one infant and one preschooler in 2022 in Yuma County (\$59,499). This indicates that many families across the region may have less income than needed to fully support themselves.

Between state fiscal years (SFY) 2018 and 2022, both the number of families with children birth to age 5 and the number of children birth to age 5 receiving Temporary Assistance for Needy Families (TANF) Cash Assistance decreased overall in both the region and the state. In SFY 2022, the percentage of young children participating in TANF in the region (1.9%) was slightly lower than the state overall (2.8%) and had decreased from 2.5% in SFY 2018.

Participation in the Supplemental Nutrition Assistance Program (SNAP) by households with young children declined overall in the Yuma Region between SFY 2018 and 2022, as did participation across the state. However, contrary to the continued decrease across the state between SFY 2021 and 2022, the number of families with young children participating in SNAP increased in the region during those years, from 5,969 to 6,149. The number of young children birth to age 5 participating in SNAP also decreased overall between SFY 2018 and 2022 in both the region and state, but again the region saw an increase in participation between SFY 2021 (n=8,535) and 2022 (n=8,921) not seen across the state. The percentage of young children participating in SNAP was higher in the region than across Arizona during SFY 2018 to 2022, with 59% of children birth to age 5 participating in the region in SFY 2022, compared to 40% across the state.

The number of children birth to age 4 enrolled in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) in the Yuma Region and across the state generally declined in recent years, with the exception of a slight uptick in enrollment in the region and state in 2022. The pattern of participation by young children in WIC differed slightly between the region and state, with declines from 2018 to 2020 followed by increases through 2022 in the region, whereas participation declined across the state until 2021 before increasing in 2022. WIC participation rates were high in 2022, with 96% of women, 98% of infants and 96% of children enrolled receiving benefits that year in the Yuma Region.

The number of lunches served through the National School Lunch Program (NSLP), Summer Food Service Program (SFSP), and Child and Adult Care Food Program (CACFP) varied substantially between program years 2019-20 and 2021-22. After the change in school meal policy following the start of the COVID-19 pandemic, meal service through SFSP increased nearly fivefold in Yuma County between 2019-20 and 2020-21, while meal service through NSLP fell by more than two-thirds. In the 2021-22 school year, NSLP meal service increased and SFSP meal service decreased, though neither program has yet returned to pre-pandemic levels. Compared to 2019-20, the number of lunches served through CACFP more than tripled in Yuma County in 2021-22, indicating higher ongoing participation in CACFP following the onset of the pandemic.

Unemployment rates in Yuma County track with Arizona's but tend to be higher. Despite the spike in unemployment at the onset of the COVID-19 pandemic in 2020, unemployment rates fell to their lowest level in six years in 2022 with a 12.5% unemployment rate in Yuma County and a 3.8% rate across Arizona. The labor force participation rate is lower in the Yuma Region (55%) than across Arizona (61%), meaning that the region has a higher proportion of adults who are not in the labor force (45%) compared to Arizona as a whole (39%). An estimated 88% of young children in the Yuma Region live in families with at least one parent in the labor force, similar to the proportion across the state (90%). In addition, six in 10 children birth to age 5 in the region (60%) live with all parents in the labor force, making it likely that these families need some form of child care.

Traditionally, housing has been deemed affordable for families if it costs less than 30% of annual household income. Nearly three in 10 households (27%) in the region and across the state (29%) spend 30% or more of their income on housing. Housing costs do differ by home ownership status, with fewer homeowners in the region and state (21% for both) spending 30% or more of household income on housing, compared to 41% of renter-occupied households in the region and 45% across the state.

The McKinney-Vento Act definition of homelessness includes children living in shelters, transitional housing, campgrounds, motels, trailer parks and cars, as well as children whose families are temporarily living within another family's household. Less than 2% of students enrolled in public and charter schools in the region (n=209) and state (n=11,161) experienced homelessness in the 2021-22 school year.

More than eight in 10 households (81%) in the Yuma Region have both a computer (including smartphones) and broadband internet connectivity, lower than the proportion across Arizona overall (88%). Looking at the population, most individuals (86%) in the Yuma Region live in households with both a computer and internet connection. Children are slightly more likely to live in a household with a computer and an internet connection, with 90% of those under age 18 with this access in the region.

Educational Indicators. In the 2021-22 school year, 628 children were enrolled in preschool in the Yuma Region. Kindergarten through 3rd grade enrollments for the region were all much higher, ranging from a low of 2,588 in kindergarten to a high of 2,843 children enrolled in 3rd grade. Across the region. kindergarten through 3rd grade chronic absence rates increased more than fivefold from the 2019-20 (7%) to 2021-22 (39%) school year and more than quadrupled across the state during the same period from (2019-20, 8%; 2021-22, 34%).

The prevalence of migrant and seasonal farmworkers, due to the importance of agriculture in the region, may impact school attendance and chronic absenteeism. In the 2021-22 school year, 13% of students enrolled in Yuma County schools (grade K-12) were migrant students, compared to less than 2% of students statewide. Children in these families may face additional educational barriers due to frequent moves, social and cultural isolation, strenuous work outside of school and poverty. Recognizing the importance of migratory workers, the federal government established the Migrant Education Program to ensure that all migrant students are supported through high quality educational programs.

In the 2021-22 school year, 34% of 3rd grade students in the Yuma Region were meeting or exceeding proficiency expectations for 3rd grade English Language Arts, lower than the proportion across Arizona (41%). A slightly lower percentage (33%) were meeting or exceeding proficiency expectations for Math, again lower than students across the state (40%). In the region, passing rates for the 3rd grade English Language Arts assessment increased from 24% in the 2020-21 school year to 34% the next year. During the same period, passing rates increased from 35% to 41% across the state. Third grade Math passing rates increased in the region from 23% in the 2020-21 school year to 33% in the 2021-22 school year compared to an increase from 36% to 40% during the same period across the state.

Four- and five-year graduation rates in the Yuma Region have remained slightly above state rates in recent years. In 2021 (the most recent year of data available for both rates), the four-year graduation rate for the region was 82% and the five-year graduation rate was 87%. Both rates were higher than state four- and five-year graduation rates that year (76% and 79%, respectively). The 7th-12th grade dropout rate for the region varied little between the 2019-20 (2%) and 2021-22 (3%) school years.

Just under half of adults (48%) in the region have more than a high-school education, less than the proportion across the state (65%). In 2020 and 2021, 80% of births in the region were to mothers who had at least a high school diploma, General Educational Development (GED) certificate or higher educational attainment, below the proportions across Arizona in 2020 (84%) and 2021 (85%).

Early Learning. In the Yuma Region, 40% of children (ages 3 and 4) were estimated to be enrolled in preschool or kindergarten, which is similar to the proportion across the state (36%). Preschool enrollment in the region increased slightly in recent years from 38% to 40%, contrary to the slight decrease seen across the state during the same period (37% to 36%). In 2021, preschool enrollment in Arizona hit a 10-year low, which makes the Yuma Region's increase in enrollments a particularly heartening finding.ⁱⁱ

Most licensed child care capacity in the region is provided by child care centers (94%), with a small proportion provided by family child care providers (6%). Given there are 9,487 children with all parents in the labor force in the region according to the 2017-2021 ACS, an availability of only 5,582 child care slots suggests that many of these parents face challenges in finding quality child care for their children.

An area is labeled a child care desert if the ratio of children to child care slots is 3 to 1 or more. Looking collectively across all children birth to age 5, the Yuma Region is not considered a desert. However, for infant and 1-year old care, slots are much more limited. There are more than four (4.6) times the number of 1-year-olds in the region as available slots for those children, and for infants, the deficit is even more extreme with more than 16 (16.1) times the number of infants for every available infant child care slot. While this pattern is similar across the state, the limited availability of infant and 1-year-old child care is notable in the region. There were only 666 slots for infants and 1-year-olds in Arizona Department of Health Services (ADHS)-licensed child care providers in July 2023 in the region. Given that the 2020 Census estimated 4,734 children under age 2 in the region, this child care capacity may not meet the needs of all who want or need care for their very young children.

The median monthly costs of child care show that care for children ages 1 to 5 provided by certified family homes and public schools in Yuma County are the lowest priced types of care in the region ranging from \$583 to \$630 per month (depending on a child's age) for full-time care. For most care settings, care for infants is the most expensive in the county and the state, with the median monthly cost for infant care in licensed centers (\$788) and small group homes (\$735) the highest in the county, but below the costs of that care across the state (\$949 and \$761, respectively). Licensed centers in Yuma County are notably more expensive than home-based care, and there are relatively few slots with the more budget-friendly providers. Child care costs as a percentage of income are slightly elevated in Yuma County compared to the state overall. In 2022, sending an infant to a licensed center in Yuma County cost just below one-sixth (18%) of a family's income, compared to 15% for families across the state. The percentage of income potentially spent on older children's care was lower in comparison in both the region and state. Median child care costs have also been increasing in the county and state since 2018. For example, the cost of care in the most available type of care in Yuma County, licensed centers,

_

[&]quot;For more information, see the https://www.firstthingsfirst.org/wp-content/uploads/2023/12/State-Needs-and-Assets-Report-2023.pdf

increased 25% for one infant, 21% for one 1–2-year-old and 24% for one 3–5-year-old between 2018 and 2022.

The number of children eligible for and receiving Arizona Department of Economic Security (DES) child care assistance in the region has mirrored the pattern seen across the state in recent years. Increases in both the number of children eligible for and the number of children receiving assistance in the year after the onset of the COVID-19 pandemic, 2021, were followed by decreases in both the region and state in 2022. The proportion of eligible families not using DES child care assistance also decreased in the region and state from 2020 (region 13.5%; Arizona 18.3%) to 2022 (region 8%; Arizona 9.2%). Children are automatically eligible for DES child care assistance when they are involved with Arizona Department of Child Safety (DCS). For DCS-involved children, the number of children eligible for assistance in the region has decreased in recent years, from 188 young children in 2018, to 162 in 2022, similar to the pattern seen across the state. Again, like the pattern seen across the state, the receipt of DES assistance among eligible DCS-involved children increased from 2020 to 2021, but then decreased again in 2022.

The 76 Quality First child care providers in the Yuma Region enrolled 2,277 young children in SFY 2023. Almost three-quarters (74%) of children in Quality First sites in the region were enrolled at a site with a 3-5-star rating, indicating a quality provider. This was higher than across Arizona, where 68% of children enrolled in Quality First sites were at a site with a 3-5-star rating. About one in six children enrolled in a Quality First provider site in the region (379 of 2,277; 17%) were served by Quality First Scholarships in SFY 2023.

In May 2023, 24 licensed or registered child care providers in the Yuma Region were nationally accredited, representing 18% of providers in the region. These accredited providers had the capacity to serve 1,020 children, which represents 18% of child care capacity in the region. DES defines quality environments as child care providers with a 3-, 4- or 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. At the regional level in 2022, 72% of non-DCS involved young children and 90% of DCS- involved children receiving DES child care assistance were enrolled in quality environments, higher proportions than across the state as a whole (68% non-DCS; 72% DCS).

Children birth to age 2 are most frequently referred to the Arizona Early Intervention Program (AzEIP) by physicians in both the Yuma Region and across the state. In federal fiscal year (FFY) 2022, 57% of AzEIP referrals in the region and 56% across the state were from physicians. Referrals by parents or family and from other sources (most often child care or early learning programs in the region) were the next most common for both the region and state. Just over four in 10 young children (42%) referred to AzEIP in FFY 2022 were found eligible (18%) or received services (24%) in the Yuma Region, a higher proportion than the 37% referred across the state who were found eligible (16%) or received services (21%). Fewer referrals in the region resulted in no contact (14%), meaning that multiple attempts to contact a child's family were unsuccessful, compared to referrals resulting in no contact across the state (19%). In the Yuma Region, the number of children birth to age 2 receiving services from AzEIP increased between October 2018 (n=147) and October 2022 (n=218) contrary to the overall decrease

seen across the state during the same period. The Yuma Region and the state were serving a notably lower number of children with Division of Developmental Disabilities (DDD) services in SFY 2019 through 2022, compared to SFY 2017 and 2018. In SFY 2022, 70 children birth to age 5 received DDD services in the region.

Qualifying children may receive services from AzEIP and/or DDD, a number which can be used to estimate the total number of young children receiving early intervention services in a region. The total number of children birth to age 2 receiving AzEIP and/or DDD services decreased overall between SFY 2019 and 2022 in the region and state. Following a low of 129 children served in the region in SFY 2021, 149 young children received AZEIP and/or DDD services in the region in SFY 2022. Based on 2020 Census population counts, 3.1% of children birth to age 2 were receiving AzEIP and/or DDD services in the region, compared to 2.6% across the state in SFY 2022.

The number of preschoolers with disabilities served by local education agencies (LEAs) has decreased overall in both the region and the state since SFY 2020. In SFY 2022, 257 preschoolers with disabilities were served in the Yuma Region. Although this represents a decrease since SFY 2020, this is higher than the number of preschoolers with disabilities served in the region in SFY 2018 (n=215) and SFY 2019 (n=255). Forty-four percent of preschoolers with disabilities receiving LEA services in the region had a developmental delay, 28% had a preschool severe delay and another 26% had a speech or language impairment.

The pattern of kindergarten through 3rd grade student enrollment in special education in public and charter schools between SFY 2018 and 2022 was similar for the region and the state. Following three years of steady increase from SFY 2018 to 2020, the number of students fell to a five-year low of 1,012 in SFY 2021 before increasing to 1,047 in SFY 2022. In SFY 2022, 34% of the 1,047 students (K-3rd) enrolled in special education in the region were diagnosed with a speech or language impairment, 27% with a developmental delay, 15% with autism and 11% with a specific learning disability, proportions similar to those across the state.

Child Health. In the Yuma Region, more than one in eight people (13%) do not have health insurance coverage, slightly higher than the proportion across the state of Arizona overall (11%). Health insurance coverage for young children is higher than that of the overall population in the region, with only 7% of children birth to age 5 not having health insurance, the same as the proportion seen across the state (7%). The proportion of young children without health insurance has decreased in the region in recent years from 11% in the 2012-2016 ACS to 7% in the 2017-2021 ACS and to a greater degree than across the state (8%, 2012-2016 ACS; 7%, 2017-2021 ACS). The proportion of births in the region paid for by the Arizona Health Care Cost Containment System (AHCCCS) or the Indian Health Services (IHS, which covers less than 0.5% of births in the Yuma Region) decreased from 63% in 2018 to 58% in 2022 but remained above the state proportions across those years.

Rates of timely prenatal care have fluctuated in the Yuma Region in recent years but decreased overall between 2018 and 2022. The region consistently had a lower proportion of births to mothers who began prenatal care in the first trimester compared to Arizona between 2018 and 2022, with 60% in that

category in the region in 2022, compared to 71% across the state. In addition, the region had a higher proportion of births to mothers with inadequate prenatal care over those years, with 6.1% with no prenatal care at all and 6.6% with fewer than five visits if they did have prenatal care in 2022 compared to births across the state (2.3% and 4.7%, respectively).

The region and state have seen a slight decrease in the proportion of births to teenaged mothers overall between 2018 and 2022. Births to mothers under age 20 fell from 8.8% in 2018 to 6.9% in 2022 in the Yuma Region, slightly higher than the proportions across Arizona (5.8% in 2018; 4.6% in 2022). The Yuma Region had a low percentage of births to mothers who smoked cigarettes while pregnant, and this proportion decreased from 2.1% in 2018 to 1.7% in 2022. The proportion of births to mothers who smoked cigarettes in the region was lower than across the state from 2018 to 2022, and the regional proportions across all those years met the Healthy People 2030 target of 4.3% or less.

Between 2018 and 2022, 236 newborns in the region were hospitalized because of maternal drug use during pregnancy, with an average length of stay of 9.7 days. In the region this equates to 1.6 newborns hospitalized due to maternal drug use during pregnancy per 100 live births, less than half the rate of 3.3 per 100 statewide.

More than a third of births in the region and a quarter of births in the state in recent years were to mothers with pre-pregnancy obesity, and this proportion increased in the region from 28.1% in 2018 to 36.9% in 2022. The proportion of births to mothers with gestational diabetes has also increased in the region from 6.9% in 2018 to 10.7% in 2022.

The proportion of babies born at low birth weight in the region is just below the proportion across the state, with 7.3% of births at low birth weight in the Yuma Region and 7.8% in Arizona in 2022. In the region, this proportion has increased slightly since 2018 (6.1%). The proportion of preterm births (less than 37 weeks gestation) in the region was also just below the state in recent years with the region at 9.6% and the state 10.0% in 2021 (the most recent year that both data points were available). In 2022, 10.1% of births were preterm in the region, meaning that the region did not meet the Healthy People 2030 target of 9.4% or fewer births before 37 weeks gestation. Between 2018 (7.7%) and 2020 (9.0%), the region met this target, indicating an increasing trend of preterm births in more recent years.

Births with an admission to a neonatal intensive care unit (NICU) in the region have increased over the last five years and have risen above the rates seen across the state starting in 2019 (2018: region 7.3%; state 7.6% and 2021: region 9.5%; state 7.9%). In 2022, 9.6% of births in the region had a NICU admission (data at the state level were unavailable).

In the Yuma Region, rates of breastfeeding were similar to those across the state between 2018 and 2020, before increasing above state rates in 2021 and 2022. In 2022, 84% of WIC-enrolled infants were ever breastfed, compared to 79% statewide.

Childhood immunizations protect against many diseases, including diphtheria, tetanus and pertussis (DTaPⁱⁱⁱ); polio; and measles, mumps and rubella (MMR). Across all required immunizations, children in child care in the Yuma Region had higher vaccination rates (DTaP 94.6%; Polio 95.9%; MMR 97.3%) than the state as a whole (DTaP 90.6%; Polio 92.2%; MMR 93%) in the 2022-23 school year. Both the Yuma Region and state also met the Healthy People 2030 DTaP immunization target of 90%. Not surprisingly, immunization exemptions among children in child care have been notably lower in the region than the state since the 2018-19 school year, with the regional rate of children receiving exemptions from all required vaccines about one third of the statewide rate in the 2022-23 school year (1.3% compared to 4%).

The Yuma Region also had higher kindergarten immunization rates in the 2022-23 school year (DTaP 95.3%; Polio 96.1%; MMR 95.7%) compared to the state (DTaP 89.6%; Polio 90.3%; MMR 89.9%). The region met the Healthy People 2030 kindergarten MMR immunization target of 95%, which the state did not. Again, the region had notably lower rates of children in kindergarten receiving personal belief exemptions and exemptions from all required vaccinations between the 2018-19 and 2022-23 school years than across the state. During the 2022-23 school year, 2.6% of children in kindergarten received a personal belief exemption in the region compared to 7.3% of children statewide, and 1.8% of children in kindergarten in the region received exemptions from all required vaccines compared to 4.6% statewide.

The pattern of confirmed and probable cases of respiratory syncytial virus (RSV) and influenza in young children birth to age 5 were similar in both the region and state with an increase in RSV cases since 2020, but a marked decrease in influenza in 2021, followed by a steep increase. In 2022, there were 136 cases of RSV and 137 cases of influenza in young children in the region, much higher numbers than the previous year (87 RSV; <6 influenza).

Falls were the most common unintentional injuries that led to emergency department visits for children birth to age 4 in both the region and the state between 2018 and 2022, followed by 'other' injuries and being 'struck by or against' an object or person. During those years, there were 2,442 emergency department visits due to falls in the region, 1,129 for other reasons and 607 due to being struck. The two most common injuries prompting inpatient hospitalizations were the same for the region and state, with falls being most common followed by poisoning. In the region, fire or hot objects were the third most common cause of inpatient hospitalizations followed by 'other' injuries, whereas across the state, 'other' injuries were the third most common injuries prompting inpatient hospitalizations. Between 2018 and 2022, 21 young children in the region were hospitalized due to falls, 14 for poisoning and 10 due to fire or hot objects.

Between 2019 and 2021, the infant mortality rate was higher in the Yuma Region (6.9), compared to the state (5.4); neither the region nor the state rate met the Healthy People 2030 target of 5.0 or less. Overall, 124 children birth to age 17 died in the Yuma Region between 2018 and 2021. Just over one in

_

iii The DTaP vaccine immunizes against Diphtheria, Tetanus and Pertussis.

six deaths (18%) were due to congenital malformations (birth defects), with accidents being the second most common cause of death (17%). The third leading cause of death in the region, maternal complications, accounted for almost one in 10 deaths (9%), and the fourth leading cause, low birth weight, accounted for 7% of deaths of children under 18. This means that one in three child deaths in the region were due to conditions related to maternal and infant health. In Arizona, maternal complications accounted for only 2% of these deaths across the state, compared to the much larger proportion of 9% in the Yuma Region.

Family Support and Literacy. The number of non-fatal opioid-related overdoses have increased in Yuma County overall since 2017 – from 41 in that year to 216 in 2021. This increase runs counter to an overall decrease seen across the state during those same years. Overdose related deaths have increased markedly in past years across the state, and to a lesser degree in the county with less than 10 deaths in the county each year between 2017 and 2020 before increasing to 15 opioid-related deaths in the county in 2021. To help address opioid addiction, the state of Arizona has made three resources available in recent years; the Opioid Assistance and Referral line launched in 2018, no cost availability of naloxone (also called Narcan, a medication that rapidly reverses opioid overdose) to many organizations across the state through ADHS and access to naloxone without a prescription at pharmacies.

The number of child abuse and neglect reports assigned for investigation by DCS increased overall in Yuma County and across the state between the first six months of 2020 and the last six months of 2022. However, as numbers across the state began to decrease after a high in the latter half of 2021, numbers continued to rise in Yuma County. In the last half of 2022, there were 552 child abuse and neglect reports assigned for investigation in the county. The number of children under 18 removed by DCS decreased overall in Yuma County and across the state between January 2020 and December 2022. A low of 37 children were removed by DCS in the county in the last six months of 2022. Neglect was the most common type of substantiated maltreatment during this period in both the county (87%) and state (71%), followed by physical abuse (13% and 24%, respectively).

In the last six months of 2022, over half (55%) of young children birth to age 5 placed in out-of-home care by DCS across Arizona were able to remain with family through a kinship placement. Children in DCS custody most often exited out-of-home care to be reunified with their parents (55%) or adopted (39%). The number of licensed kinship foster homes in Arizona steadily declined between January 2018 and June 2022, though there was an uptick again in the latter half of 2022. Generally, fewer than one in five kinship homes are licensed, and the number of unlicensed kinship homes increased slightly overall during the same period and exceeded the number of community foster homes during the most intense years of the pandemic.

ABOUT THIS REPORT

There is growing acknowledgement of the role our physical, social, and economic environments play in our day-to-day health and wellbeing.² These factors, known as the social determinants of health, have an especially strong effect on the development of young children ages birth to 5 and accumulate over time.^{3, 4} Measuring and addressing these conditions can significantly impact not only early health and education outcomes, but also health and economic circumstances later in life.^{5, 6, 7} It is important to acknowledge that structural inequities in access to quality health care, schools, and education as well as living, working and leisure conditions lead to disparate outcomes within and between groups of people.⁸ For example, the U.S.'s history of segregation, discriminatory policy and differential investment across communities has created generational disparities in outcomes for people of color.⁹ Native communities have additionally experienced periods of genocide, forced relocation and assimilation leading to systemically poorer economics and health compared with other groups.^{10, 11} This Needs and Assets Report covers many structural and social determinants of health including population characteristics, economic characteristics, early learning and educational indicators, child health, and family support and literacy for the First Things First (FTF) Yuma Region.

The data in this report come from a variety of sources including federal and state agencies and local agencies or service providers. Federal government sources include publicly available data from the 2020 Census and the 2017-2021 American Community Survey (ACS) 5-Year Estimates. Data in this report from the ACS summarize the responses from samples of residents taken between 2017 and 2021. Because these estimates are based on samples rather than the total population, ACS data should not be considered exact. Estimates for smaller geographies, such as regions, are less accurate than estimates for larger geographies, such as the state, because they are based on smaller sample sizes.

Data were provided to FTF by state agencies including the Arizona Department of Health Services, the Arizona Department of Education and the Arizona Department of Economic Security. In most cases, the data in this report were calculated specifically for the Needs and Assets process and are more detailed than the data that are published by these agencies for the general public. Whenever possible, this report will use data tailored to the region, but in some cases, there are only county-level or statewide data available to report. This report also includes publicly available data for the state and counties to supplement data received through specific requests, including from state agencies such as the Arizona Department of Commerce's Office of Economic Opportunity and the Arizona Department of Child Safety semi-annual child welfare reports.

In most tables in this report, the top rows of data correspond to the FTF Yuma Region. Not all data are available at the FTF regional level because not all data sources analyze their data based on FTF regional boundaries. The other table rows present data that are useful for comparison purposes, including Yuma County, the state of Arizona and national estimates or targets where available. Data tables and graphs are as complete as possible. Data which are not available for a particular geography are indicated by the abbreviation "N/A." State agencies have varying policies about reporting small values. Entries such as "<11" are used when the count is too small to be reported and has been suppressed to protect privacy. In

some cases, table entries will indicate a range of values such as "1 to 9" because the suppression policy prevented the vendor from knowing the exact value, but comparison of these ranges of possible values to other values in the table or figure may still be useful. Table entries of "DS" indicate that data have been suppressed and we are unable to provide a useful range of possible values. Additional data tables not included in the body of the report can be found in Appendix 1.

THE YUMA REGION

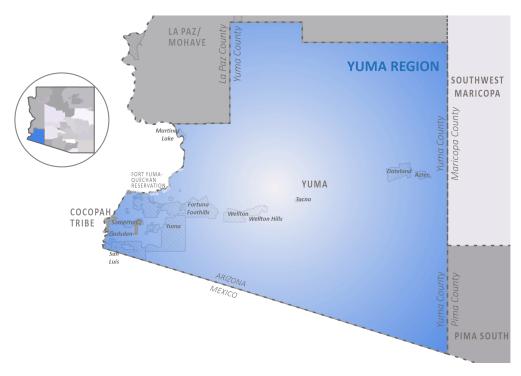

The First Things First (FTF) regional boundaries were established to create regions that (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments, (d) facilitate the ability to convene a Regional Partnership Council, and (e) allow for the collection of demographic and indicator data.

The FTF Yuma Region lies in the southwest corner of Arizona, bordering Mexico and California. The Yuma Region has the same boundaries as Yuma County minus the Cocopah Tribe reservation lands (which are included in the FTF Cocopah Tribe Region). The region does include the Arizona portion of the land belonging to the Fort Yuma Quechan Indian Tribe. In this report, data reported for the Yuma Region do not include the Cocopah Indian Reservation, but data reported for Yuma County do include the Cocopah Reservation.

Figure 1 shows the geographical area covered by the Yuma Region. Additional information available at the end of this report includes a map of the region by zip code and a table listing zip codes for the region in Appendix 3, and a map and a list of school districts in the region in Appendix 4.

POPULATION CHARACTERISTICS

POPULATION CHARACTERISTICS

Why It Matters

Accurate information about the number and characteristics of families allows policymakers and program providers to understand what resources are needed in their communities, including where services should be located and how to tailor offerings to the specific needs of those who are likely to use them. ^{12, 13, 14, 15} For example, identifying which communities have high numbers of families with young children can facilitate strategic investments in libraries, playgrounds, health care facilities, social services and educational systems, which can help families with young children thrive. ^{16, 17} Program and policy decisions that are informed by data on the composition of children's home and community environments help ensure more effective supports for families and have a greater chance to improve well-being, economic security and educational outcomes for children.

2020 Census data and its limitations

The release of 2020 Census data in 2023 provided updated information on the population of Arizona and the nation as a whole. However, the 2020 Census faced unprecedented challenges in conducting an accurate count of the population, the foremost of which included the COVID-19 pandemic and its related disruptions to institutions such as local and tribal governments, schools and health care facilities. ^{18, 19, 20, 21, 22} Overall, data quality reviews of the 2020 Census have concluded that the data are generally reliable and accurate for the overall population; however, specific groups that have been undercounted in the past were again undercounted, often more severely. ²³ Young children birth to age 4 were undercounted by 3-5% nationwide (meaning that as many as one in 20 children birth to age 4 were missed by the Census). ²⁴ Nationwide, American Indians living on reservations and Hispanic or Latino individuals were also undercounted by 5.6% and 5.0%, respectively, marking notable increases in undercounting rates compared to the 2010 Census (4.9% and 1.5%, respectively). These undercounts are important to keep in mind when using Census data, particularly data for young children and for communities with substantial American Indian and Hispanic or Latino populations. Undercounted communities risk receiving fewer resources for at least the next decade since the decennial census counts are the basis of many federal funding allocations. ^{25, 26}

What the Data Tell Us

Population, race and ethnicity

While young children make up a small proportion of the overall population, their well-being has wide-reaching impacts on families, social service systems and the state's future population. Continued investment in children's well-being and the well-being of their families was deemed by the National Academy of Sciences as "the most efficient strategy" for strengthening the future workforce and supporting a thriving community. ^{27, 28}

Knowing the racial-ethnic composition of communities can inform efforts to ensure equitable access to services and resources. Many racial and ethnic minority groups in the U.S. experience reduced access to health care services, more poverty and housing inequality, poorer living conditions and increased rates of homelessness in comparison to non-Hispanic White Americans. ^{29, 30, 31, 32} These inequities result in disproportionately worse overall health as indicated by higher rates of disease and illness, untreated mental and physical health conditions and lower life expectancies within these groups.³³ Understanding a community's racial-ethnic composition is also critical for identifying communities facing higher risks from environmental and public health hazards due to historic underinvestment and other factors—as the COVID-19 pandemic made woefully clear.³⁴

How the Yuma Region is faring

- According to the U.S. Census, the Yuma Region had a population of 203,024 in 2020 (Table 1), a 4% increase from 2010 when 194,934 people resided in the region (Table 2). Conversely, the population of young children birth to age 5 decreased 15% over the same period from 17,983 in 2010 to 15,249 in 2020. The increase in the total population in the region (4%) was lower than that seen across the state which experienced a 12% increase in the total population from 2010 to 2020. The decrease in the population of young children of 15% in the region was higher than the 12% decrease seen across the state during those years (Figure 2).
- Fewer than one in five households (17%) in the region included a young child in 2020, a higher proportion of households than across the state (13%) (Table 1).
- The 2020 Census undercount of young children^{iv} appears more pronounced in the Yuma Region than that seen across the state, as the number of live births in the region between 2015 and 2020 (n=17,832) is higher than the number of young children birth to age 5 in the 2020 Census (n=15,249) by a difference of +17%. Across the state, a +1% difference is seen comparing the same indicators (Figure 3).
- Most Yuma Region residents identify as Hispanic or Latino (64% of all age population, 79% of children birth to age 4), higher proportions than the population of young children (44%) and all ages (31%) identifying as Hispanic or Latino across the state. The Yuma Region has a lower proportion of the total population and children birth to age 4 identified as Non-Hispanic White (32% and 19% respectively), Black or African American (3% and 4%), American Indian (3% for both), or Asian or Pacific Islander (2% and 3%) than the state across those categories. The proportion of the total population and young child population identified as Multiracial in the region (26% and 31%, respectively) were higher than those proportions across the state (14%) and 21%, respectively) (Figure 4 & Figure 5).

iv See "2020 Census data and its limitations" at the beginning of the Population Characteristics section for fuller context on the 2020 Census undercount of young children.

POPULATION CHARACTERISTICS 25

Note: The six percentages shown in this figure may sum to more or less than 100% because (a) persons reporting Hispanic ethnicity are counted twice if their race is Black, American Indian, Asian, Pacific Islander, or any combination of two or more races, (b) persons reporting any other race are not counted here unless they have Hispanic ethnicity, and (c) rounding.

Immigrant families and language use

Both immigrants of all ages and children born to immigrant parents are growing populations in the U.S., and the U.S. is continuing to become an increasingly diverse nation.^{35, 36} Immigrant parents in Arizona

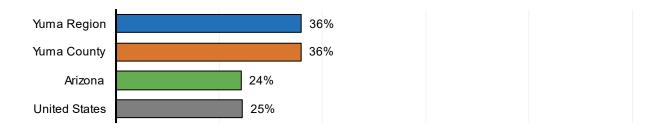

have typically lived in the U.S. for at least nine years, and the vast majority of young children of these foreign-born parents are citizens.^{37, 38, 39} Some immigrant parents avoid using social services for which they and their children legally qualify due to fear of deportation or risking their legal status in the country.^{40, 41, 42} This can put immigrant families and children at risk of reduced access to medical care and increased food insecurity, which can lead to long-term impacts on health and educational attainment, as well as community-level economic impacts.^{43, 44, 45, 46} Understanding the needs of immigrant families and their children is essential to ensuring they have access to available resources that can help them thrive.⁴⁷

Language provides an important connection to family, community and culture. ⁴⁸ Mastery of more than one language is an asset in school readiness and academic achievement and may offer cognitive and social-emotional benefits in early school experiences and across one's lifetime. ^{49, 50, 51, 52, 53} However, families with lower English proficiency may face barriers to accessing information about health care and other services or engaging with their children's teachers. Children who do not yet have a full grasp of English may also experience difficulties in school, impeding their academic success and resulting in negative health outcomes. ^{54, 55} Knowing the languages spoken and level of English proficiency in a region can inform the development of resources and services in multiple languages, ensuring that they are accessible to all families. ^{56, 57}

How the Yuma Region is faring

- Thirty-six percent of children birth to age 5 in the region live with foreign-born parents, a higher proportion than across the state overall (24%) (Figure 6).
- Household language use also reflects these demographic patterns; a much larger proportion of individuals speak Spanish at home in the Yuma Region (53%) compared to across Arizona (20%) (Figure 7).
- Of those who speak a language other than English at home, a larger proportion of individuals do not speak English "very well" in the region (20%) compared to the state (8%) (Figure 8).
- Similarly, the percentage of limited-English-speaking households in the region (11%) is almost three times that of the state (4%) (Figure 9).
- The number of English Language Learners (ELL) increased slightly in the Yuma Region between the 2020-21 and 2021-22 school years, with 7,780 ELL students enrolled in preschool through 12th grade in the region in the 2021-22 school year. This represents 20% of students enrolled in all grades in the region that school year. Across Arizona, 8% of students in all grades were ELL students in both the 2020-21 and 2021-22 school years (Table 4).

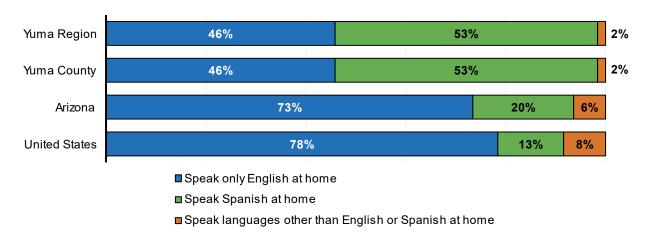

Figure 6. Children birth to age 5 living with parents who are foreign-born, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Table B05009

Note: The term "parent" here includes stepparents.

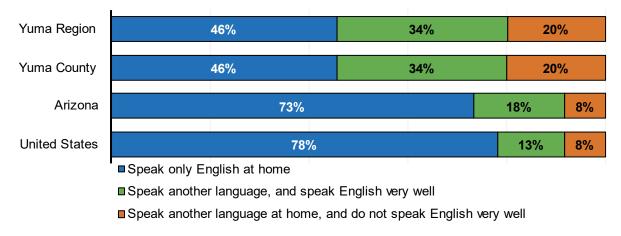

Figure 7. Language spoken at home (by persons ages 5 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Table C16001

Note: The three percentages in each bar may not sum to 100% because of rounding. The American Community Survey (ACS) no longer specifies the proportion of the population who speak Native North American languages for geographies smaller than the state. In Arizona, Navajo and other Native American languages (including Apache, Hopi, and O'odham) are the most commonly spoken (2%), following English (73%) and Spanish (20%).

Figure 8. English-language proficiency (for persons ages 5 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2023). American Community Survey five-year estimates 2017-2021, Table C16001

Note: The three percentages in the figure should sum to 100%, but may not because of rounding.

Figure 9. Share of households that are limited-English-speaking, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Table C16002 Note: A "limited-English-speaking" household is one in which no one over the age of 13 speaks English very well.

Table 4. Number of English Language Learners enrolled in all grades, 2020-21 to 2021-22

Geography	Number of PS-12 s English Langu	students who were uage Learners	Percent of PS-12 students who were English Language Learners		
Geography	2020-21	2021-22	2020-21	2021-22	
Yuma Region	7,765	7,780	21%	20%	
Yuma County	7,711	7,717	21%	20%	
Arizona schools	86,405	91,881	8%	8%	

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Notes: Please note that there are several charter schools located in the region that have district offices in Pima or Maricopa County; these schools are assigned by ADE to the county where the district office is located, but we include these schools in the regional schools row. This is the main driver of discrepancies between the county and the region. English Language Learners are students who do not score 'proficient' in the English language based on the Arizona English Language Learning Assessment (AZELLA) and thus are eligible for additional supportive services for English language acquisition. Legislation in Arizona requires children in Arizona public schools be taught in English, and English Language Learners to attend English immersion programs. Senate Bill 1014 passed in 2019, increased the flexibility districts have in structuring English Language Learners immersion programs, and lessened the duration required of this instruction. For more information see https://www.azed.gov/oelas/structured-english-immersion-models

Family and household composition

Young children in Arizona live in many types of families, each of which has possible implications for child development. 58 For example, families with two married parents tend to offer stability that promotes child well-being. 59, 60, 61 Single-parent households tend to be at higher risk for poverty, and can face challenges accessing health and education resources. 62, 63, 64, 65, 66, 67, 68 Multi-generational living. particularly arrangements where grandparents live in the home with children and parents, has long been practiced in some cultures and communities but is becoming increasingly common in U.S. families of all racial and ethnic groups. ^{69, 70, 71, 72} These living arrangements can offer financial and social benefits but also specific stressors, such as managing conflicts in parenting styles and family roles. ^{73, 74, 75, 76, 77} It is also increasingly common for children to live in kinship care, defined as the care of children by someone other than their parents, such as relatives or close friends. ^{78, 79, 80} These kinship caregivers, especially grandparents who care for their grandchildren, can face unique challenges, including navigating the logistics of informal guardianship (e.g., difficulties in registering children for school), coping with parental absence and addressing the challenges of being an aging caregiver for a young child. 81, 82, 83, 84 Each of these family structures carries with it a unique set of strengths and challenges that are important to consider in relation to the health and development of children. 85, 86, 87

How the Yuma Region is faring

- More than half of young children in the Yuma Region live in two-parent households; 51% live with two married parents or stepparents, which is lower than Arizona overall (59%). More young children in the region (45%) live in a household with one parent compared to the state (37%) (Table 5).
- Seventeen percent of children birth to age 5 in the region live in their grandparent's household, higher than the proportion of young children in those living situations across the state (13%) (Figure 10).
- Of grandparents who live with and are responsible for their grandchildren under age 18 in the Yuma Region, most are female (60%), similar to the proportion across the state (62%) and do not speak English very well (61%), a much higher proportion than across Arizona as a whole (21%). Almost half (48%) of these grandparents in the region are in the labor force and almost three in 10 (28%) have an income below the poverty level. Three in 10 (30%) do not have the child's parent in the household, just below the proportion across Arizona (33%) (Table 6).
- Overall, in the region, 10% of grandparents have grandchildren under age 18 in their household with no parent present, similar to the proportion across the state (11%) (Figure 11).

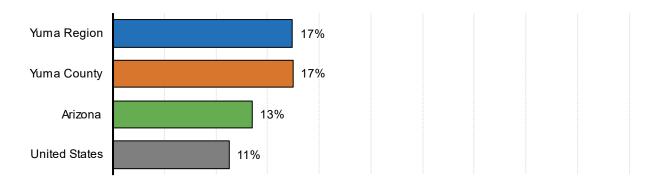

Table 5. Living arrangements for children birth to age 5, 2017-2021 ACS

Geography Yuma Region	Estimated number of children (birth to 5 years old) living in households	Living with two married parents 51%	Living with one parent	Living not with parents but with other relatives 2%	Living with non- relatives 1%
Yuma County	16,546	51%	45%	2%	1%
Arizona	496,219	59%	37%	3%	2%
United States	23,353,556	64%	32%	2%	2%

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Tables B05009, B09001, & B17001

Note: The four percentages in each row should sum to 100%, but may not because of rounding. The term "parent" here includes stepparents. Please note that due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one parent' category).

Figure 10. Grandchildren birth to age 5 living in a grandparent's household, 2020 Census

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P14, PCT11.

Note: This table includes all children (under 6 years old) living in a household headed by a grandparent, regardless of whether the grandparent is responsible for them, or whether the child's parent lives in the same household.

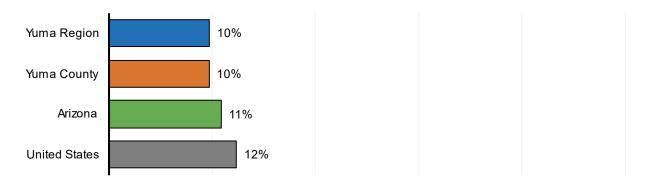

Table 6. Selected characteristics of grandparents who are responsible for one or more grandchildren under age 18 in their households, 2017-2021 ACS

			Percent of these grandparents who:					
Geography	Estimated number of grandparents who live with and are responsible for grandchildren under 18 years old	Do not have the child's parents in the household	Are 60 years old or older	Are female	Do not speak English very well	In labor force	Have an income below the poverty level	
Yuma Region	1,999	30%	47%	60%	61%	48%	28%	
Yuma County	2,012	30%	47%	60%	61%	49%	28%	
Arizona	56,079	33%	45%	62%	21%	57%	21%	
United States	2,319,443	38%	47%	63%	14%	56%	18%	

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Tables B10051, B10054, B10056, & B10059

Note: Grandparents are considered responsible for their grandchild or grandchildren if they are "currently responsible for most of the basic needs of any grandchildren under the age of 18" who live in the grandparent's household.

Figure 11. Percent of grandparents who are living with their grandchildren birth to age 17 with no parent present in the household, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Tables B10051, B10054, B10056, & B10059

Note: The denominator in this figure is all grandparents living with grandchildren (including both grandparents who are responsible for their grandchildren and those that are not).

Additional data tables related to *Population Characteristics* can be found in Appendix 1 of this report.

ECONOMIC CIRCUMSTANCES

ECONOMIC CIRCUMSTANCES

Why it Matters

A family's economic stability impacts children's well-being and predicts a variety of health outcomes. ⁸⁸ Children who grow up in poverty and unstable economic conditions are more likely to experience negative effects on their cognitive, behavioral, social and emotional development compared to those in stable economic environments. ^{89, 90, 91, 92, 93} The challenges they face might continue into adulthood, and such difficulties may be passed on to the next generation. ^{94, 95, 96} Poverty also affects children by straining parent well-being and parent-child interactions. Stressors related to poverty, like unemployment, food and housing insecurity and poor mental and physical health, make it difficult for caregivers to provide the necessary support for children's optimal development. ⁹⁷ In light of these broad impacts, economic stability is a key social determinant of health and is included as a domain in the Healthy People 2030 Objectives. ^v

What the Data Tell Us

Income and poverty

Poverty is associated with reduced access to nutrition, green space and health care and greater exposure to psychosocial stress and environmental toxins, factors that can both directly and indirectly hinder children's growth and brain development. ^{98, 99, 100} Children living in poverty are thus at a higher risk of negative impacts including being born at a low birth weight, lower school achievement and poor health. ^{101, 102, 103, 104, 105, 106, 107} Economic hardship is included in some definitions of adverse childhood experiences (ACEs) and children living in poverty experience other non-economic ACEs, such as parental divorce or separation, exposure to violence, parental incarceration and living with someone with mental illness or a substance use disorder, at higher rates than children in higher income households. ^{108, 109} Given the many negative effects of poverty on child development, programs that alleviate poverty through providing cash assistance or food, housing or health care assistance can improve child well-being. ¹¹⁰

The Temporary Assistance for Needy Families Cash Assistance Program (TANF)^{vi} provides temporary cash benefits and supportive services to children and families. Eligibility is based on citizenship or qualified resident status, Arizona residency and limits on resources and monthly income.¹¹¹

^v For more information on the Economic Stability Healthy People 2030 Objectives please see https://health.gov/healthypeople/objectives-and-data/browse-objectives/economic-stability

vi For more information see: https://www.acf.hhs.gov/ofa/programs/temporary-assistance-needy-families-tanf and https://des.az.gov/ca

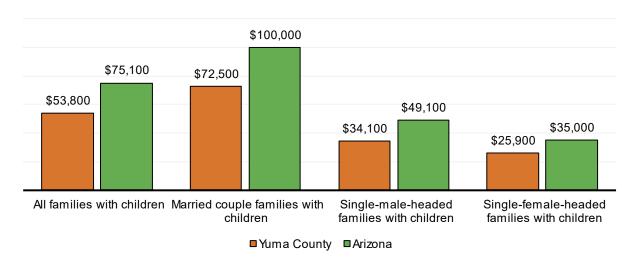

How the Yuma Region is faring

- Median family income for families in Yuma County is lower than for families in Arizona across all household types. The median income for married couple families with children in Yuma County (\$72,500) is lower than married couple families across Arizona (\$100,000), and this income is more than double the median income for single-male-headed families (\$34,100) and nearly triple that of single-female-headed families (\$25,900) in Yuma County (Figure 12).
- According to 2017-2021 American Community Survey (ACS) estimates, rates of poverty in the region across the entire population (18%) and for children birth to age 5 (26%) are higher than those across the state (13% and 20%, respectively). Rates of poverty for young children have decreased since 2012-2016 ACS estimates across the state (2012-2016, 28%; 2017-2021, 20%) whereas in the region these rates have changed little during the same period (2012-2016, 27%; 2017-2021, 26%) (Figure 13 & Figure 14).
- Over half of young children in the Yuma Region (53%) live below 185% of the federal poverty level (FPL), a higher proportion than across the state (39%) (Figure 15). Even this relatively higher category of income for a family of four (185% FPL = \$50,836) falls below the self-sufficiency standard vii for two parents with one infant and one preschooler in 2022 in Yuma County (\$59,499). This indicates that many families across the region may have less income than needed to fully support themselves.
- Between state fiscal years (SFY) 2018 and 2022, both the number of families with children birth to age 5 and the number of children birth to age 5 receiving TANF decreased overall in both the region and the state. In SFY 2022, the percentage of young children participating in TANF in the region (1.9%) was slightly lower than the state overall (2.8%) and had decreased from 2.5% in SFY 2018 (Figure 16 & Figure 17).

ECONOMIC CIRCUMSTANCES 39

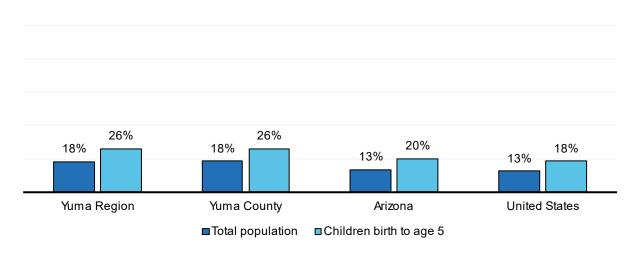

Figure 12. Median family income for families with children birth to age 17, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B19126

Note: Half of the families in the population are estimated to have annual incomes above the median value, and the other half have incomes below the median. The median family income for all families includes families without children birth to age 17.

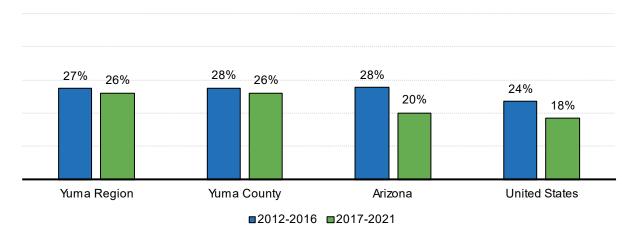

Figure 13. Rates of poverty for persons of all ages and for children birth to age 5, 2017-2021 **ACS**

Source: U.S. Census Bureau. (2020). American Community Survey 5-year estimates 2017-2021, Table B17001

Note: This graph includes only persons whose poverty status can be determined. Adults who live in group settings such as dormitories or institutions are not included. Children who live with unrelated persons are not included. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677.

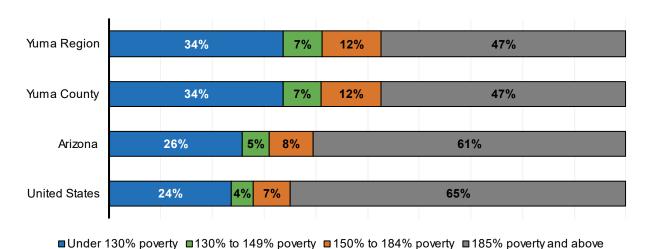

Figure 14. Rates of poverty for children birth to age 5, 2012-2016 and 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17001. U.S. Census Bureau. (2017). American Community Survey 5-year estimates 2012-2016, Table B17001.

Note: This graph includes only persons whose poverty status can be determined. Adults who live in group settings such as dormitories or institutions are not included. Children who live with unrelated persons are not included. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677.

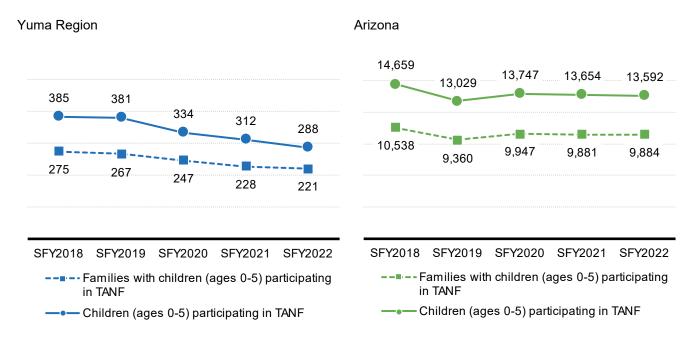

Figure 15. Children birth to age 5 living at selected poverty thresholds, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17024

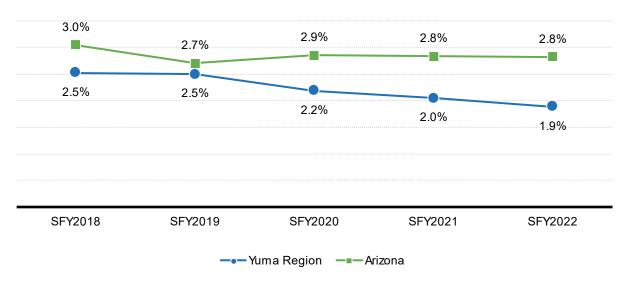

Note: The four percentages in each bar should sum to 100% but may not because of rounding. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677. The 185% thresholds are \$50,836 and \$34,552, respectively.

Food security

Many families struggle with consistent access to "enough food for an active, healthy life," a problem known as food insecurity. 112 Food insecurity is linked with many aspects of child and parent well-being; it can be a major source of stress for parents and has been linked to health and behavioral problems for children, such as poorer parent-child attachment, decreased social skills and self-control and increased risk of depression. 113, 114, 115, 116, 117, 118

The Supplemental Nutrition Assistance Program (SNAP; also referred to as "nutrition assistance" and "food stamps"), viii is administered by the Arizona Department of Economic Security and aims to support working families who are unable to afford the food necessary to sustain their health with their income alone. Nationally, about one in every five children participates in SNAP, and families on average receive a benefit of up to \$2.61 per person for each meal. 119 The SNAP program has been shown to reduce hunger and improve access to healthy food options among those who utilize it. 120

The Special Supplemental Nutrition Program for Women, Infants and Children (WIC) ix is a federally funded program administered by the Arizona Department of Health Services aimed to support economically disadvantaged women who are pregnant, postpartum and/or breastfeeding, along with infants and young children. The program's services include directing participants to health services, nutrition and breastfeeding education and supplemental funding for food. In Arizona, WIC provided an average monthly benefit of \$42 per month in 2022, lower than the national average of \$48 per month. 121

School meals provide another important nutritional safety net for children and their families. The National School Lunch Program (NSLP), administered by the Arizona Department of Education (ADE) and funded by the United States Department of Agriculture (USDA), provides meals for students of lowincome families at a reduced price. The Summer Food Service Program (SFSP), xi also funded by the USDA and administered by ADE, works to keep all children birth to age 18 fed when school is out of session by providing free meals (breakfast, lunch, supper) and snacks at community sites. SFSP unites community sponsors like camps, faith-based organizations and schools with sites like parks, libraries, community centers and apartment complexes in high-need areas to distribute food. 122 In March 2020, in response to school closures due to the COVID-19 pandemic, the USDA issued waivers allowing yearround operation of SFSP to serve meals to children of all ages engaging in remote learning; these waivers remained in effect through June 2022 and led to increased meal service through SFSP compared to NSLP for many schools. 123 The Child and Adult Care Food Program (CACFP), xii also funded by the USDA, gives reimbursements to participating child care centers, preschools, emergency centers and after-school programs for nutritious meals and snacks served to eligible children. Eligible providers

viii For more information see: https://www.fns.usda.gov/snap/supplemental-nutrition-assistance-program and https://des.az.gov/na

ix For more information see: https://www.fns.usda.gov/wic and https://www.azdhs.gov/prevention/azwic/

^{*} For more information see: https://www.azed.gov/hns/nslp

xi For more information see: https://www.azed.gov/hns/sfsp

xii For more information see: https://www.azed.gov/hns/cacfp

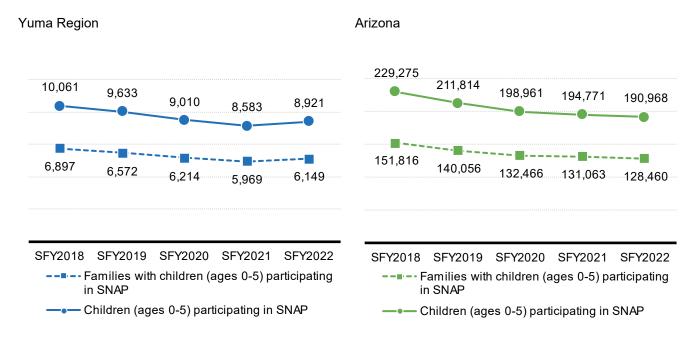

include for-profit child care centers serving at least 25% free or reduced-price lunch participants or any non-profit program. 124

How the Yuma Region is faring

- Participation in SNAP by households with young children declined overall in the Yuma Region between SFY 2018 and 2022, as did participation across the state. However, contrary to the continued decrease across the state between SFY 2021 and 2022, the number of families with young children participating in SNAP increased in the region during those years, from 5,969 to 6,149. The number of young children birth to age 5 participating in SNAP also decreased overall between SFY 2018 and 2022 in both the region and state, but again the region saw an increase in participation between SFY 2021 (n=8,583) and 22 (n=8,921) not seen across the state. The percentage of young children participating in SNAP was higher in the region than across Arizona during SFY 2018 to 2022, with 59% of children birth to age 5 participating in the region in SFY 2022, compared to 40% across the state (Figure 18 & Figure 19).
- The number of children birth to age 4 enrolled in WIC in the Yuma Region and across the state generally declined in recent years, with the exception of a slight uptick in enrollment in the region and state in 2022. The pattern of participation^{xiii} by young children in WIC differed slightly between the region and state, with declines from 2018 to 2020 followed by increases through 2022 in the region, whereas participation declined across the state until 2021 before increasing in 2022 (Figure 20).
- WIC participation rates were high in 2022, with 96% of women, 98% of infants and 96% of children enrolled receiving benefits that year in the Yuma Region (Figure 21).
- The number of lunches served through the NSLP, SFSP, and CACFP meal programs varied substantially between program years 2019-20 and 2021-22. After the change in school meal policy following the start of the COVID-19 pandemic, meal service through SFSP increased nearly fivefold in Yuma County between 2019-20 and 2020-21, while meal service through NSLP fell by more than two-thirds. In the 2021-22 school year, NSLP meal service increased and SFSP meal service decreased, though neither program has yet returned to pre-pandemic levels (Figure 22).
- Compared to 2019-20, the number of lunches served through CACFP more than tripled in Yuma County in 2021-22, indicating higher ongoing participation in CACFP following the onset of the pandemic (Figure 22).

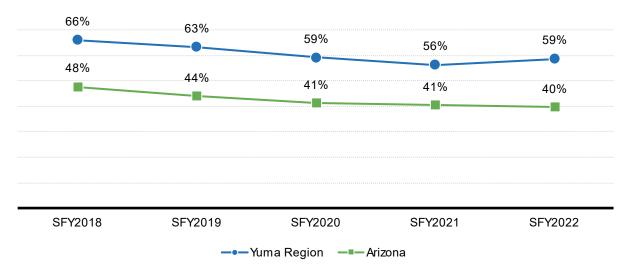

xiii Please note that since the onset of the COVID-19 pandemic, WIC programs nationwide have offered virtual visits (as well as in-person visits).

Note: Due to the COVID-19 pandemic, the USDA issued a substantial number of waivers for school nutrition programs to allow greater flexibility for schools to get meals to students in need. More information on the pandemic's effect on school nutrition can be found on the ADE website: https://www.azed.gov/hns/covid19

Employment

Unemployment and underemployment xiv can impact families in ways that affect children's health and well-being. 125 Unemployment can limit access to resources that support children's physical and mental health, like health insurance, and can also contribute to family stress, conflict, homelessness and child abuse. 126, 127 Children with parents who have lost their jobs may also experience poorer school performance and behavioral issues, resulting in grade repetition, suspension or expulsion. 128

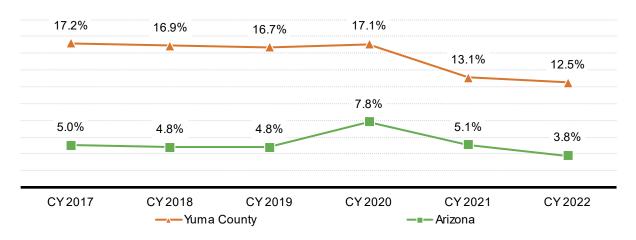

Education and employment support programs for parents and caregivers are important for increasing wages and improving the economic stability of families. "Two-generation" or "2Gen" approaches address the needs of both parents and children simultaneously through programs to support children and families together, such as a family literacy program that provides educational support to parents while enrolling children in free high-quality preschool. 129, 130, 131 These programs have the goal of decreasing the intergenerational effects of poverty by building parental capacity and protective factors within families. 132, 133, 134

xiv Underemployment means that someone works fewer hours than they would like or is in a job that does not require the skills or training that they have.

How the Yuma Region is faring

- Unemployment rates in Yuma County track with Arizona's but tend to be higher. Despite the spike during the onset of the COVID-19 pandemic in 2020, unemployment rates fell to their lowest level in six years in 2022 with a 12.5% unemployment rate in Yuma County and a 3.8% rate across Arizona (Figure 23).
- The labor force participation rate^{xv} is lower in the Yuma Region (55%) than across Arizona (61%). The region has a higher proportion of adults who are not in the labor force (45%) compared to Arizona as a whole (39%) (Table 7 & Figure 24).
- An estimated 88% of young children in the Yuma Region live in families with at least one parent in the labor force, similar to the proportion across the state (90%). Six in 10 children birth to age 5 in the region (60%) live with all parents in the labor force, making it likely that these families need some form of child care (Table 8 & Figure 25).

Figure 23. Average annual unemployment rates (not seasonally adjusted), 2017 to 2022

Source: Arizona Commerce Authority (2021), Office of Economic Opportunity, Local Area Unemployment Survey (LAUS)

xv The "labor force" is all persons who are working (employed) or looking for work (unemployed). The "labor force participation rate" is the fraction of the population who are in the labor force, whether employed or unemployed. Persons not in the labor force are mostly students, stay-at-home parents, retirees, and institutionalized people. The "unemployment rate" is the fraction of the civilian labor force which are unemployed.

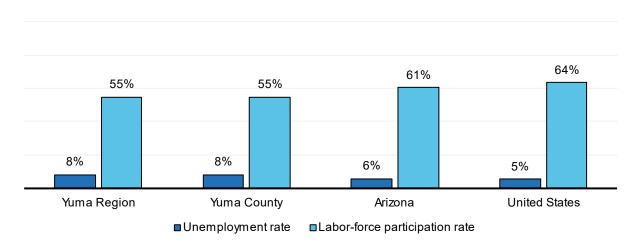

Table 7. Unemployment and labor-force participation for the population ages 16 and older, 2017-2021 ACS

Geography	Estimated working-age population (age 16 and older)		Labor-force participation rate		In the labor force but unemployed	In armed forces	Not in the labor force

The five percentages in each row should sum to 100% but may not because of rounding. Please note that due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one parent' category).

Housing instability and internet access

Housing instability can have harmful effects on the development of young children. High housing costs relative to family income are associated with increased risk for overcrowding, frequent moving, poor nutrition, declines in mental health and homelessness. 135, 136, 137 High relative housing costs leave inadequate funds for other necessities, such as food and utilities. 138 This can negatively affect the physical, social-emotional and cognitive development of children, with severe forms of housing instability associated with poorer performance in school. 139, 140

Another increasingly important utility in homes is reliable internet access. Access to broadband (highspeed) internet enables quick access to a far greater number of resources and information, telehealth options and other opportunities that can be critical for education and employment. Internet access has been deemed a "super determinant" of health because of its influence on more traditional social determinants of health such as education, employment, health care access and social connection. ¹⁴¹ Household access to computers and high-speed internet is also important for school-aged children who may need this technology for school assignments and projects, particularly during the later years of primary education and beyond. 142 Lack of access to reliable high-speed internet disproportionately occurs in rural areas and pockets of segregated urban areas, and this disparate access is known as the digital divide. Due to the importance of high-speed internet access, the federal government has instituted several funding initiatives to improve access to and the affordability of high-speed internet, including in Arizona.xvi

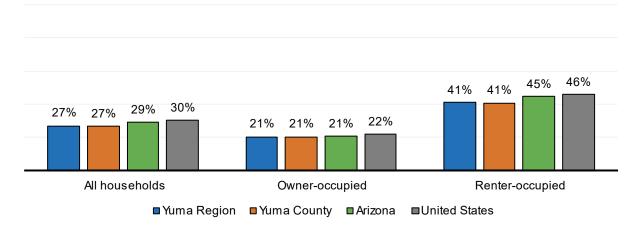

How the Yuma Region is faring

- Traditionally, housing has been deemed affordable for families if it costs less than 30% of annual household income. 143 Nearly three in 10 households (27%) in the region and across the state (29%) spend 30% or more of their income on housing. Housing costs do differ by home ownership status, with fewer homeowners in the region and state (21% for both) spending 30% or more of household income on housing, compared to 41% of renter-occupied households in the region and 45% across the state (Figure 26).
- The McKinney-Vento Act definition of homelessness includes children living in shelters, transitional housing, campgrounds, motels, trailer parks and cars, as well as children whose families are temporarily living within another family's household. Less than 2% of students enrolled in public and charter schools in the region (n=209) and state (n=11,161) experienced homelessness in the 2021-22 school year (Table 9).
- More than eight in 10 (81%) households in the Yuma Region have both a computer (including smartphones) and broadband internet connectivity, lower than the proportion across Arizona overall (88%) (Table 10).

xvi For more information, please see https://internetforall.gov/program/digital-equity-act-programs

• Most individuals (86%) in the Yuma Region live in households with both a computer and internet connection. Children are slightly more likely to live in a household with a computer and an internet connection, with 90% of those under age 18 with this access in the region (Figure 27 & Figure 28).

Figure 26. Percent of households spending 30% or more of household income on housing by home ownership status, 2017-2021 ACS

Table 9. Students experiencing homelessness (all grades) enrolled in public and charter schools, 2019-20 to 2021-22

	Number of students experiencing homelessness			Percent of students who were experiencing homelessness		
Geography	2019-20	2020-21	2021-22	2019-20	2020-21	2021-22
Yuma Region	232	147	209	<2%	<2%	<2%
Yuma County	215	128	175	<2%	<2%	<2%
Arizona schools	12,931	8,542	11,161	<2%	<2%	<2%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Please note that there are several charter schools located in the region that have district offices in Pima or Maricopa County; these schools are assigned by ADE to the county where the district office is located, but we include these schools in the regional schools row. This is the main driver of discrepancies between the county and the region. The McKinney-Vento Act provides funding and supports to ensure that children and youth experiencing homelessness have access to education. Under the McKinney-Vento Act, children are defined as homeless if they lack a "fixed, regular, and adequate nighttime address." This includes children living in shelters, cars, transitional housing, campground, motels, and trailer parks, as well as children who are living 'doubled up' with another family due to loss of housing or economic hardship. More information can be found on the ADE website: https://www.azed.gov/homeless

Additional data tables related to Economic Circumstances can be found in Appendix 1 of this report.

EDUCATIONAL INDICATORS

EDUCATIONAL INDICATORS

Why it Matters

A community's K-12 education system can support positive outcomes for children, families and the overall well-being of the community. Individuals who have higher levels of education tend to live longer and healthier lives. ¹⁴⁴ Graduating from high school, in particular, is associated with better health, financial stability and socio-emotional outcomes as well as a lower risk for incarceration compared to dropping out of high school. ^{145, 146} Children with parents that have attained higher levels of education are more likely to do well in school, such as score higher in reading, math and science in their first four years of school and attain higher levels of education themselves. ^{147, 148, 149} High-quality early learning experiences also set a strong foundation for children's learning in kindergarten, elementary school and beyond. ¹⁵⁰ When children participate in high-quality early education, they are more likely to perform better in reading and math in later grades. ¹⁵¹ Given these lifetime and intergenerational impacts of educational attainment, it is critical to provide substantial support for early education and promote policies and programs that encourage the success of Arizona's children.

What the Data Tell Us

School attendance and absenteeism

School attendance is an important factor in predicting the academic performance and future health of children. Chronic absenteeism, defined as missing 10% of school days in a school year, predicts a student experiencing academic difficulties and even dropping out of school entirely. ¹⁵² Children who are part of a racial or ethnic minority group, have disabilities or other health conditions, or live in low-income families are at increased risk of absenteeism. ^{153, 154}

How the Yuma Region is faring

- In the 2021-22 school year, 628 children were enrolled in preschool in the Yuma Region. Kindergarten through 3rd grade enrollments for the region were all much higher, ranging from a low of 2,588 in kindergarten to a high of 2,843 children enrolled in 3rd grade (Table 11).
- Across the region, kindergarten through 3rd grade chronic absence rates increased more than fivefold from the 2019-20 (7%) to 2021-22 (39%) school year and more than quadrupled across the state during the same period from (2019-20, 8%; 2021-22, 34%) (Figure 29).
- In the Yuma Region, the prevalence of migrant and seasonal farmworkers, due to the importance of agriculture in the region, may impact school attendance and chronic absenteeism. In the 2021-22 school year, 13% of students enrolled in Yuma County schools (grade K-12) were migrant students, compared to less than 2% of students statewide. Children in these families may face additional educational barriers due to frequent moves, social and cultural isolation, strenuous work outside of school and poverty. 155,156 Recognizing the importance of migratory workers, the

federal government established the Migrant Education Program^{xvii} to ensure that all migrant students are supported through high quality educational programs.

Table 11. Preschool to 3rd grade students enrolled in public and charter schools, 2021-22

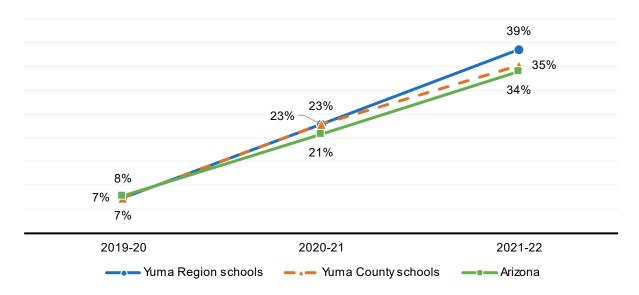

Geography	Preschool	Kindergarten	1st Grade	2nd Grade	3rd Grade
Yuma Region schools	628	2,588	2,655	2,780	2,843
Yuma County schools	628	2,587	2,650	2,775	2,840
Arizona schools	17,840	79,423	79,202	82,342	82,243

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Note: Please note that there are slight difference in school-level and county-level tabulations by ADE, which contributes to the small differences in student counts between the region and the state. Additionally, regional data includes charter schools that have physical locations in the region but may have district offices in another county (ADE assigns schools to counties based on the location of the district office).

xvii For more information on the Arizona Migrant Education Program please see https://www.azed.gov/migrant

Figure 29. Chronic absenteeism rates for kindergarten to 3rd grade students, 2019-20 to 2021-22

Source: Arizona Department of Education (2023). [Absenteeism Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Please note that school closures and transitions to distance learning substantially affected how attendance was tracked by schools in the spring of 2020. Regional data includes charter schools that have physical locations in the region but may have district offices in another county (ADE assigns schools to counties based on the location of the district office).

Table 12. Migrant students (grades K-12) enrolled in public and charter schools, 2019-20 to 2021-22

	Numb	er of migrant stu	idents	Percent of students who were migrant students

Note: Migrant students are those students participating in the Arizona Migrant Education Program, a federally-funded, state-run program that provides supplemental services to the children of migrant farmworkers.

Achievement on standardized testing

All Arizona public schools, including both district and charter schools (but not private schools), are required to administer state and federally mandated standardized tests. Between 2019 and 2022, the statewide English Language Arts (ELA) and Math assessment tool for 3rd through 8th graders in public

schools was Arizona's Statewide Achievement Assessment for English Language Arts and Math (AzM2), previously called Arizona's Measurement of Educational Readiness to Inform Teaching (AzMERIT). xviii, 157, 158 The Move on When Reading policy, enacted by the Arizona legislature in 2010, states that a 3rd grade student shall not be promoted to 4th grade if their reading score falls far below the 3rd grade level, as established by the State Board of Education. xix, 159

These policies are intended to help identify struggling readers who may benefit from more targeted literacy interventions. Children's 3rd grade reading comprehension and proficiency skills can predict their future academic success, such as their likelihood of graduating high school and attending college. 160 Poor reading skills are associated with a six-fold increase in the likelihood of dropping out of high school in comparison to proficient readers. 161

How the Yuma Region is faring

- In the 2021-22 school year, 34% of 3rd grade students in the Yuma Region were meeting or exceeding proficiency expectations for 3rd grade English Language Arts, lower than the proportion across Arizona (41%). A slightly lower percentage (33%) were meeting or exceeding proficiency expectations for Math, again lower than students across the state (40%) (Table 13 & Table 14).
- In the region, passing rates for the 3rd grade English Language Arts assessment increased from 24% in the 2020-21 school year to 34% the next year. During the same period, passing rates increased from 35% to 41% across the state (Figure 30).
- Third grade Math passing rates increased in the region from 23% in the 2020-21 school year to 33% in the 2021-22 school year compared to an increase from 36% to 40% during the same period across the state (Figure 31).

xviii In 2022, AzM2 was replaced by Arizona's Academic Standards Assessment (AASA).

xix Exceptions exist for students identified with or being evaluated for learning disabilities or reading impairments, English language learners and those who have demonstrated reading proficiency on alternate forms of assessment approved by the State Board of Education. Students who test in the 'far below' proficiency range can also be promoted to 4th grade if they complete summer school and then demonstrate reading at a proficient level. Given these exceptions, historically very few 3^{rd} grade students (<1%) have been retained due to Move on When Reading. As of 2022, schools with early elementary grade students are now required to screen all kindergarten and first grade students for dyslexia and have at least one teacher who has complete ADE-approved trainings in reading instruction, intensifying instruction and understanding and recognizing dyslexia.

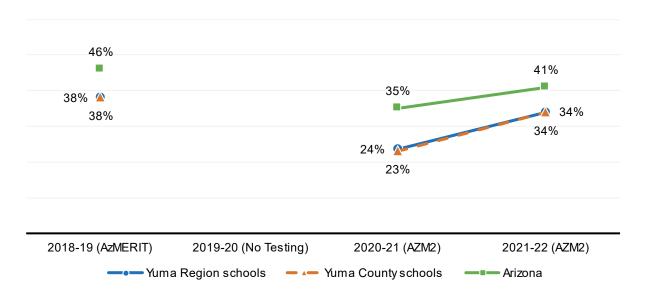

Table 13. Assessment results: 3rd Grade English Language Arts, 2021-22

Geography	Students Tested		Approaches	Meets	Exceeds	Passing
Yuma Region schools	DS	55%	11%	24%	10%	34%
Yuma County schools	2,788	55%	11%	24%	10%	34%
Arizona schools	79,586	47%	12%	26%	15%	41%

Graduation rates and adult educational attainment

High school graduation and dropout rates within a region can provide insight into the assets within and challenges faced by a community and its future workforce. Adults who graduated from high school have higher rates of employment, higher incomes and better overall health compared to adults who dropped out of high school, even if they received a high school equivalency degree, such as the General Educational Development certificate (GED). 162 Maternal education is associated with an array of child

outcomes starting with infant health, ^{163, 164, 165} and both targeted and universal programs serving children from families with lower educational backgrounds can support child development. ^{166, 167}

In contrast to the U.S. as a whole, Arizona has a larger proportion of disconnected youth, defined as teenagers ages 16 to 19 who are neither attending school nor employed, xx which has been linked to negative physical and mental health outcomes and higher rates of unemployment. Native youth, both nationally and in Arizona, are disproportionately disconnected and therefore particularly vulnerable to these negative outcomes and may need additional support. 169

How the Yuma Region is faring

- Four- and five-year graduation rates in the Yuma Region have remained slightly above state rates in recent years. In 2021 (the most recent year of data available for both rates), the four-year graduation rate for the region was 82% and the five-year graduation rate was 87%. Both rates were higher than state four- and five-year graduation rates that year (76% and 79%, respectively) (Figure 32 & Table 15).
- The 7th-12th grade dropout rate for the Yuma Region varied little between the 2019-20 (2%) and 2021-22 (3%) school years (Table 16).
- Just under half of adults (48%) in the Yuma Region have more than a high-school education, less than the proportion across the state (65%) (Figure 33).
- In 2020 and 2021, 80% of births in the Yuma Region were to mothers who had at least a high school diploma, GED or higher educational attainment, below the proportions across Arizona in 2020 (84%) and 2021 (85%) (Table 17).

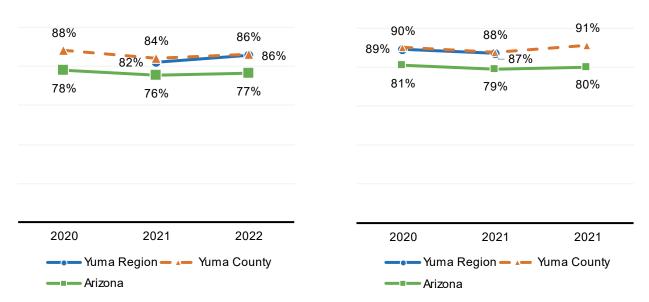

_

xx Age ranges used for 'disconnected youth' vary by source, with some estimates including both teenagers ages 16-19 and young adults ages 20-24 and others focusing on only teenagers or young adults.

Figure 32. Trends in 4-year and 5-year graduation rates, 2020 to 2022

4-year graduation rates

5-year graduation rates

Arizona schools	78%	76%	77%	81%	79%	80%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Regional data were not available for 2020 4-year graduation rates, and 5-year graduation rates for 2022 had yet to be released at the time of the data pull for this report (December 2023). Differences between the region and county are due to the inclusion of charter schools with district offices located in another county in regional data. The 5-year graduation rate reflects the percentage of students who graduated high school within 5 years of entry. See

https://www.azed.gov/sites/default/files/2017/08/2018%2006%2001%20Graduation%20DO%20and%20Persistence%20Rate%20Tech% 20Manual.pdf?id=598a34233217e10ce06647ff

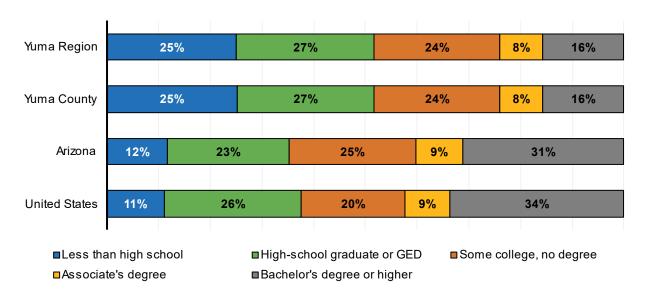

Table 16. 7th to 12th grade dropout rates, 2019-20 to 2021-22

Geography	Dropout Rate, 2019-20	Dropout Rate, 2020-21	Dropout Rate, 2021-22
Yuma Region schools	2%	3%	3%
Yuma County schools	2%	3%	3%
Arizona Schools	3%	4%	5%

Source: Arizona Department of Education (2023). [Dropout Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Notes: Dropouts are defined by ADE as students who were enrolled in school at any time during the school year but were not enrolled at the end of the year and who did not transfer to another school, graduate, or die. Dropout rates are calculated by dividing the number of dropouts by the total enrollment. In many elementary districts, dropout rates reflect students who transferred out and were lost to follow-up.

Figure 33. Level of education for the adult population (ages 25 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Table B15002

Note: The five percentages in each bar should sum to 100%, but may not because of rounding.

Table 17. Level of education of the mothers of babies born in 2020 and 2021

Geography	Calendar year	Number of births	Mother had less than a high-school education	Mother finished high school or had GED	Mother had more than a high-school education
V D	2020	2,962	20%	31%	49%
Yuma Region	2021	2,898	20%	31%	49%
Vuma County	2020	2,972	20%	31%	49%
Yuma County	2021	2,895	20%	31%	49%
Arizona	2020	76,781	15%	27%	57%
Alizona	2021	77,857	14%	27%	58%

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.

Note: Mothers of twins are counted twice in this table. Please note that maternal education is unknown for a small number of births so totals may not sum to 100%. A small number of births are missing data on maternal educational attainment, so percentages in this table may not sum to 100%.

Additional data tables related to Educational Indicators can be found in Appendix 1 of this report.

EARLY LEARNING

EARLY LEARNING

Why it Matters

Early childhood is a pivotal time for building crucial physical, cognitive and social-emotional skills. 170, ¹⁷¹ Early experiences are important for healthy brain development and set the stage for lifelong learning and well-being. 172, 173, 174 Just as rich, stimulating environments can promote healthy development, early negative experiences can also have lasting effects. ^{175, 176} However, considering the major COVID-19 pandemic-related challenges experienced by many Arizona families, it is important to remember that predicted short- and long-term effects of adverse experiences are not inevitable. 177, 178 Access to quality early care and learning environments can be a powerful protective factor for every child, and the effects can be particularly life-changing for children facing chronic stressors and for children with disabilities. 179, 180

Quality early care and educational experiences help children develop into capable learners by supporting many crucial systems in the body. 181 In addition to promoting healthy brain development, positive and adverse experiences in the first few years of life can shape a child's immune functioning, ability to handle stress in a healthy way and capacity to learn and thrive. 182 Each of these factors contribute to being a skillful learner. 183

What the Data Tell Us

Access to early care and education

Early childhood systems play a key role in supporting children, parents, caregivers and communities as a whole. 184, 185 Unfortunately, many Arizona families continue to face obstacles when seeking quality early care and education. Communities in both urban and rural areas of Arizona face a gap between the number of young children and licensed child care slots. 186, 187, 188, 189 According to the Center for American Progress, almost half of Arizonans (48%), including the majority of rural, low-income and Hispanic or Latino families, live in a "child care desert," defined as areas where there are three times as many children as there are available child care opportunities. 190, 191

Analyses by the Bipartisan Policy Center indicate that Arizona needed an additional 76,740 licensed or registered early care and education slots to have enough for all young children in working families in 2019. 192 Because the COVID-19 pandemic forced many child care centers and home-based providers to close either temporarily or permanently, care has been disrupted for many more families in Arizona and nationwide. 193 Disruptions to child care arrangements may have been especially burdensome for Hispanic and Latino households, ¹⁹⁴ which is meaningful to Arizona given the high proportion of young children who are Hispanic or Latino compared to children nationwide. Parents and caregivers in Hispanic and Latino households were less likely to use paid leave or to simultaneously supervise their children while working – likely due to lower access to paid leave and telework options – and more likely to leave or lose their job as a result. 195

Availability and cost are especially challenging for parents seeking care for infants and young children in Arizona. For example, a family with one infant and one preschooler can expect to pay about \$1,670 per month for a licensed child care provider. 196 This monthly cost exceeds what many Arizonans pay per month for housing, creating potential financial challenges that are further compounded for families with multiple children under the age of 6. xxi, 197, 198 The Arizona Department of Economic Security (DES) provides child care assistance to financially eligible families, including specific funding for families involved with the Arizona Department of Child Safety (DCS). 199 However, families that are eligible to receive funding may not have access to child care services in their community that are licensed or that accept assistance payments, leaving them unable to utilize the funding. 200, 201

How the Yuma Region is faring

- In the Yuma Region, 40% of children (ages 3 and 4) were estimated to be enrolled in preschool^{xxii} or kindergarten, which is similar to the proportion across the state (36%).
- Preschool enrollment in the region increased slightly in recent years from 38% to 40%, contrary to the decrease seen across the state during the same period (37% to 36%). In 2021, preschool enrollment in Arizona hit a 10-year low, 202 which makes the Yuma Region's increase in enrollments a particularly heartening finding (Figure 34).
- Most licensed child care capacity in the region is provided by child care centers (94%), with a small proportion provided by family child care providers (6%). Given there are 9,487 children with all parents in the labor force in the region (see Table 8), according to the 2017-2021 American Community Survey (ACS), an availability of only 5,582 child care slots suggests that many of these parents face challenges in finding quality child care for their children (Table 18).
- An area is labeled a child care desert if the ratio of children to child care slots is 3 to 1 or more. Looking collectively across all children birth to age 5, the Yuma Region is not considered a desert. However, for infant and 1-year old care, care availability is more limited. There are more than four (4.6) times the number of 1-year-olds in the region as available slots for those children, and for infants, the deficit is even more extreme with more than 16 (16.1) times the number of infants for every available infant child care slot. While this pattern is similar across the state, the limited availability of infant and 1-year-old child care is notable in the Yuma Region. There were only 666 slots for infants and 1-year-olds in Arizona Department of Health Services (ADHS)licensed child care providers in July 2023 in the region. Given that the 2020 Census estimated

xxi In addition to the financial challenges faced by parents paying for child care, the early care and education workforce is one of the most underpaid fields in the country. Nationally, educators working with infants and toddlers are 7.7 times more likely to live in poverty compared to K-8 teachers. The median hourly wage for a child care worker in Arizona (\$11.97) is \$13.19 less per hour than what is considered a living wage for a single parent with 1 child (\$25.16). For more information on early care and education workforce wages visit https://cscce.berkeley.edu/workforce-index-2020/the-early-educator-workforce/early-educator-pay-economic-insecurity-across-thestates/

xxii The American Community Survey uses the terms nursery school and preschool interchangeably.

- 4,734 children under age 2 in the region, this child care capacity may not meet the needs of all who want or need care for their very young children (Table 19, Figure 35 & Table 3).
- The median monthly costs of child care for children aged 1 to 5 years provided by certified family homes and public schools in Yuma County are the lowest priced types of care in the region ranging from \$583 to \$630 per month (depending on a child's age) for full-time care. For most types of care, care for infants is the most expensive in the county and the state, with the median monthly cost for infant care in licensed centers (\$788) and small group homes (\$735) the highest in the county, but below the costs of that care across the state (\$949 and \$761, respectively). Licensed centers in Yuma County are notably more expensive than home-based care (Figure 36), and there are relatively few slots with the more budget-friendly providers.
- Child care costs as a percentage of income are slightly elevated in Yuma County compared to the state overall. In 2022, sending an infant to a licensed center in Yuma County cost just below one-sixth (18%) of a family's income, compared to 15% for families across the state. The percentage of income spent on older children's care was lower in comparison in both the region and state (Figure 37).
- Median child care costs have also been increasing in the county and state since 2018. For example, the cost of care in the most available type of care in Yuma County, licensed centers, increased 25% for one infant, 21% for one 1–2-year-old and 24% for one 3-5 year old between 2018 and 2022 (Table 20).
- The number of children eligible for and receiving DES child care assistance in the region has mirrored the pattern seen across the state in recent years. Increases in both the number of children eligible for and the number of children receiving assistance in the year after the onset of the COVID-19 pandemic, 2021, were followed by decreases in both the region and state in 2022. The proportion of eligible families not using DES child care assistance also decreased in the region and state from 2020 (region 13.5%; Arizona 18.3%) to 2022 (region 8%; Arizona 9.2%) (Figure 38 & Figure 39).
- Children are automatically eligible for DES child care assistance when they are involved with DCS. XXIII For DCS-involved children, the number of children eligible for assistance in the region has decreased in recent years, from 188 young children in 2018, to 162 in 2022, similar to the pattern seen across the state. The receipt of DES assistance among eligible DCS-involved children increased from 2020 to 2021, but then decreased again in 2022 (Figure 40).

EARLY LEARNING 69

xxiii Children involved with DCS include children who have been removed by DCS and placed with a foster family or kinship caregiver as well as children who are residing with their own family but receiving services from DCS (such as in-home family support and counseling). Families of these children are not required to pay a co-pay for child care.

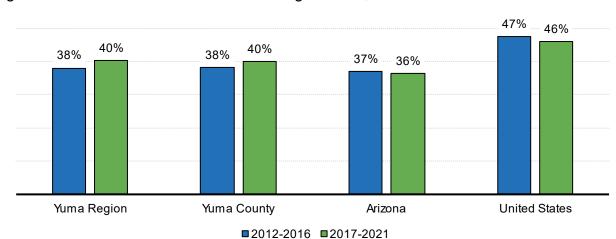

Figure 34. School enrollment for children ages 3 to 4, 2012-2016 and 2017-2021 ACS

Note: In this table, "school" may include nursery school, preschool, or kindergarten.

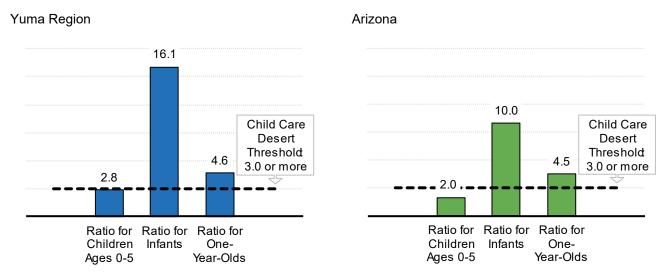

Table 18. Number and Capacity of Early Care & Education Providers active in the National Data System for Child Care, May 2023

	Total ECE	E Providers	Child care centers		Family child care providers		Nannies or individual providers	
Geography	Number	Capacity	Number	Capacity	Number	Capacity	Number	Capacity
Yuma Region	117	5,582	68	5,222	49	360	0	0
Yuma County	119	5,622	70	5,262	49	360	0	0
Arizona	2,454	211,860	1,933	208,407	516	3,435	5	18

Source: Arizona Department of Economic Security (2023). [Child Care Administration dataset]. Unpublished data.

Note: Providers in this table are those who were active in the National Data System for Child Care NACCRRAware database as of May 2023. This database of child care providers includes most state-licensed child care providers in the state of Arizona, but the database does not include informal or unlicensed providers or providers who are licensed through military or tribal authorities. Please also note that not all school-based preschools or Head Start centers participate in this data system (whereas all center-based facilities are required to be licensed and thus will appear in the ADHS licensing dataset in Table 19). The 2 providers located in the county but not the region are in the Cocopah Tribe Region.

Figure 35. Ratio of children to slots in ADHS-licensed child care facilities, July 2023

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P1, P14. ADHS (2023). [Child Care Licensing Database]. Retrieved from https://www.azdhs.gov/licensing/childcare-facilities/index.php#parentsdatabases on 12 July 2023

Note: ADHS licenses most child care centers in the state of Arizona, except for those regulated by military or tribal authorities. While these licensed slots do not account for home-based care, as evidenced in Table 18, the majority of child care capacity in the region is in center-based care. Child care deserts are defined by the Center for American Progress as areas where there are more than three times as many children as available child care slots. To see a nationwide map of childcare supply, visit https://childcaredeserts.org/

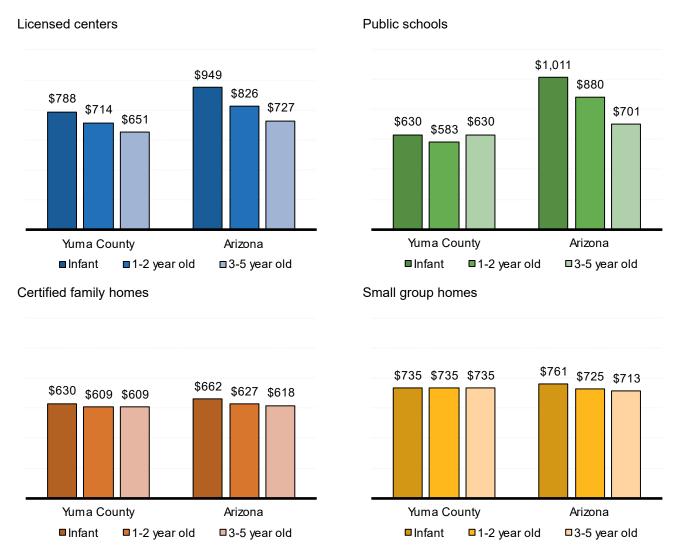

Table 19. ADHS-licensed child care providers by age of child served, July 2023

Geography	Licensed Providers Num Capacity		Infants Num. Capacity		1-year-olds Num. Capacity		Number of providers licensed for 2-year- olds	Number of providers licensed for 3- to 5- year-olds
Yuma Region	94	5,373	37	144	58	522	42	79
Yuma County	94	5,373	37	144	58	522	42	79
Arizona	2,344	246,369	822	7,474	1,136	17,323	1,217	2,175

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P1, P14. ADHS (2023). [Child Care Licensing Database]. Retrieved from https://www.azdhs.gov/licensing/childcarefacilities/index.php#parents-databases on 12 July 2023

Note: ADHS licenses most child care centers in the state of Arizona, except for those regulated by military or tribal authorities. While these licensed slots do not account for home-based care, as evidenced in Table 18, the majority of child care capacity in the region is in center-based care. The 2 providers located in the county but not the region are both school-based preschools in Amado.

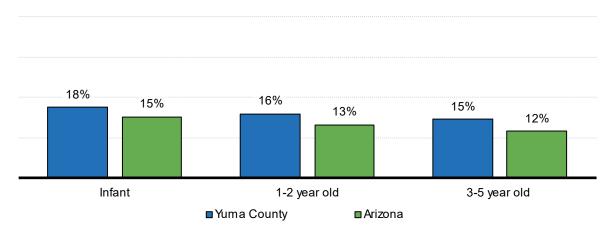

Figure 36. Median monthly charge for full-time child care, 2022

Source: Health Management Associates (2022). 2022 Child Care Market Rate Survey. Arizona Department of Economic Security. Retrieved from https://des.az.gov/sites/default/files/media/2022-Market-Rate-Survey.pdf?time=1670616239540

Note: Median monthly charges are calculated by multiplying the daily median cost of care by 21 to approximate a full month of care.

Figure 37. Cost of center-based child care for one child, as a percentage of income, 2022

Source: Health Management Associates (2022). 2022 Child Care Market Rate Survey. Arizona Department of Economic Security. Retrieved from https://des.az.gov/sites/default/files/media/2022-Market-Rate-Survey.pdf?time=1670616239540

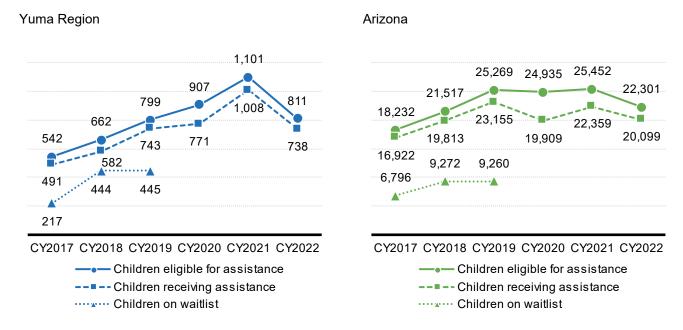

Note: Annual costs of care are calculated by multiplying the median daily cost of care by 252 to approximate a full year of care, then dividing by the median income for families with children under the age of 18 in the region. The U.S. Department of Health and Human Services Child Care and Development Fund (CCDF) Program sets a benchmark for affordable co-payments for child care at 7% of family income.

High quality early care and education

Children who begin their education in high-quality preschool programs tend to repeat grades less frequently, obtain higher scores on standardized tests, experience fewer behavior problems and are more likely to graduate from high school.²⁰³ This provides a return on investment to society through increased educational achievement and employment, reductions in crime and better overall health of children as they mature into adults. ^{204, 205} The key ingredients in positive early experiences include responsive relationships, core adaptive skills development, reduced sources of stress and appropriate nutrition – all things that quality early care and education are in a unique position to provide at the critical time to encourage optimal learning and well-being for years to come. ²⁰⁶ Early care and education shapes far more than a child's future academic achievement, and an investment in early childhood can be one of the most productive investments a community can make. ²⁰⁷

One way that the quality of early child care and education is measured in Arizona is through the Quality First program. ²⁰⁸ The program offers training and funding for participating schools and providers to improve the quality of the services they provide. The Quality First program also rates the quality of child care providers and preschools on a scale of one to five stars, with providers considered high quality when they have received a three-star rating or higher. ²⁰⁹ Quality First providers are supported by regional funding.

How the Yuma Region is faring

- The 76 Quality First child care providers in the Yuma Region enrolled 2,277 young children in state fiscal year (SFY) 2023. Almost three-quarters (74%) of children in Quality First sites in the region were enrolled at a site with a 3-5-star rating, indicating a high-quality provider. This was higher than across Arizona, where 68% of children enrolled in Quality First sites were at a site with a 3-5-star rating (Table 21; Table 22; Figure 41). About one in six children enrolled in a Quality First provider site in the region (379 of 2,277; 17%) were served by Quality First Scholarships in SFY 2023 (Table 22).
- In May 2023, 24 licensed or registered child care providers in the Yuma Region were nationally accredited, representing 18% of providers in the region. These accredited providers had the capacity to serve 1,020 children, which represents 18% of child care capacity in the region (Table 23).
- DES defines quality environments as child care providers with a 3-, 4-, or 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. At the regional level in 2022, 72% of non-DCS involved young children and 90% of DCS- involved children receiving DES child care assistance were enrolled in quality environments, higher proportions than across the state as a whole (68% non-DCS; 72% DCS) (Table 24).

	Children	ages 0-5 (non-DC	CS involved)	DCS-involved children ages 0-5			
	Enrolled in Percent in				Enrolled in	Percent in	
Geography	Received assistance	quality environment	quality environment	Received assistance	quality environment	quality environment	
Yuma Region	738	529	72%	115	103	90%	
i aiiia i togioii							
						30,0	
Yuma County	741	532	72%	115	103	90%	

Source: Arizona Department of Economic Security (2023). [Child Care Administration dataset]. Unpublished data.

Note: Quality environments are defined by DES as child care providers with a 3-, 4-, or 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. DCS-involved means that DCS is involved with the child or their family. In other words, the child has been reported to DCS and determined to need some level of supervision while in their parents' home, or the child has been removed

Young children with special needs

Timely intervention can improve the language, cognitive and socio-emotional developmental outcomes of young children who have, or are at risk for, developmental delays. ^{210, 211} Early intervention also reduces educational costs by decreasing the need for special education. ²¹² Ensuring that children have access to timely and adequate screening and intervention services from birth to age 5 can be key for preparing children for kindergarten.

In Arizona, the Arizona Early Intervention Program (AzEIP), xxiv the Division of Developmental Disabilities (DDD), xxv and the Arizona Department of Education (ADE) Early Childhood Special Education Program are designed to provide services to families with children who have special needs. xxvi AzEIP is a program under DES that provides early intervention and a variety of supportive services to Arizona children birth to age 2 with developmental delays or disabilities, as well as their families.²¹³ The goal of these services is to improve the learning and development of children and inform their family members of how they can best support their child.²¹⁴ DDD is a program under DES that provides supportive services to people of all ages with a qualifying developmental disability, including cerebral palsy, autism spectrum disorder, down syndrome, epilepsy and cognitive disabilities. ²¹⁵ Children under the age of 6 that have been assessed by AzEIP to have a qualifying disability may also receive DDD services. At age 3, children with special needs transition from AzEIP services to their local education agency (LEA), usually a school district. Each Arizona school district is mandated to participate in Child Find^{xxvii} and to provide preschool services to children with special needs either through their own schools or through agreements with other programs such as Head Start.

According to national research, insufficient funding and staffing of these programs are the greatest obstacles to identifying and providing resources for all children who would benefit from early intervention. ²¹⁶ Arizona falls in the bottom 10 states in the nation for early intervention service provision. 217 Fewer children in Arizona are accessing critical early intervention services that can identify disabilities, provide parent-coaching and encourage optimal development at home. ²¹⁸ This matters because, while early education discussions often center around pre-kindergarten for 4-year-olds, research continues to point to the impact of experiences during the first three years of life as being just as crucial for healthy brain and body development. ²¹⁹ Positively, Arizona has taken steps toward improving funding for early intervention, including being one of 10 states to cross-reference Medicaid and Early Intervention data to maximize federal Medicaid matching of funds. ²²⁰

How the Yuma Region is faring

• Children birth to age 2 are most frequently referred to AzEIP by physicians in both the Yuma Region and across the state. In federal fiscal year (FFY) 2022, 57% of AzEIP referrals in the region and 56% across the state were from physicians. Referrals by parents or family and from other sources (most often child care or early learning programs) were the next most common for both the region and state (Figure 42).

xxiv For more information on AzEIP (which is a division of the Department of Economic Security), visit https://www.azdes.gov/azeip/

xxv For more information on DDD (which is a division of the Department of Economic Security), visit https://des.az.gov/services/disabilities/developmental-disabilities

xxvi For more information on ADE's Early Childhood Special Education program, visit http://www.azed.gov/ece/early-childhood-specialeducation/ and http://www.azed.gov/special-education/az-find/

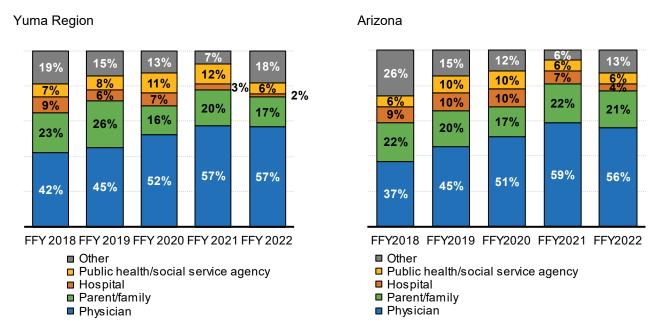

xxvii The Arizona Child Find program is a component of the Individuals with Disabilities Education Act (IDEA) that requires states to identify and evaluate all children with disabilities (birth through age 21) to attempt to ensure that they receive the supports and services they need.

- Just over four in 10 young children (42%) referred to AzEIP in FFY 2022 were found eligible (18%) or received services (24%) in the Yuma Region, a higher proportion than the 37% referred across the state who were found eligible (16%) or received services (21%). Fewer referrals in the region resulted in no contact (14%), meaning that multiple attempts to contact a child's family were unsuccessful, compared to referrals resulting in no contact across the state (19%) (Figure 43).
- In the Yuma Region, the number of children birth to age 2 receiving services from AzEIP increased between October 2018 (n=147) and October 2022 (n=218) contrary to the overall decrease seen across the state during the same period (Figure 44).
- The Yuma Region and the state were serving a notably lower number of children with DDD services in SFY 2019 through 2022, compared to SFY 2017 and 2018. Following a low of 67 young children served in SFY 2019, in SFY 2022, 70 children birth to age 5 received DDD services in the region (Figure 45).
- Qualifying children may receive services from AzEIP and/or DDD, a number which can be used to estimate the total number of young children receiving early intervention services in a region. The total number of children birth to age 2 receiving AzEIP and/or DDD services xxviii decreased overall between SFY 2019 and 2022 in the region and state. Following a low of 129 children served in the region in SFY 2021, 149 young children received AZEIP and/or DDD services in the region in SFY 2022. Using 2020 Census population counts, 3.1% of children birth to age 2 were receiving AzEIP and/or DDD services in the region, compared to 2.6% across the state in SFY 2022 (Figure 46).
- The number of preschoolers with disabilities served in LEAs has decreased overall in both the region and the state since SFY 2020. In SFY 2022, 257 preschoolers with disabilities were served in the Yuma Region. Although this represents a decrease since SFY 2020, this is higher than the number of preschoolers with disabilities served in the region in SFY 2018 (n=215) and SFY 2019 (n =255). Forty-four percent of preschoolers with disabilities receiving LEA services in the region had a development delay, 28% had a preschool severe delay and another 26% had a speech or language impairment (Figure 47 & Figure 48).
- The pattern of kindergarten through 3rd grade student enrollment in special education in public and charter schools between SFY 2018 and 2022 was similar for the region and the state. Following three years of steady increase from SFY 2018 to 2020, the number of students fell to a five-year low of 1,012 in SFY 2021 before increasing to 1,047 in SFY 2022. In SFY 2022, 34% of the 1,047 students (K-3rd) enrolled in special education in the region were diagnosed with a speech or language impairment, 27% with a developmental delay, 15% with autism and 11%

xxviii Please note that this is a unique count of children receiving AzEIP services, DDD services, or both AzEIP and DDD.

with a specific learning disability, proportions similar to those across the state (Figure 49 & Figure 50).

Note: These referral outcomes are recorded by AzEIP service providers. "No contact" means that a service coordinator made multiple attempts to contact a child's family but was unsuccessful. "Not interested" indicates that when contacted the family of the child did not proceed with screening for eligibility. Children who are "screened out" were not suspected to have a qualifying developmental delay based on an initial developmental screening with a service coordinator; children who are "assessed, not eligible" are those with a formal evaluation who were found to not have a qualifying developmental delay. "Invalid or Other" refers to cases where the child was over-age (age 3 or older) or residing outside Arizona, the referral was a duplicate, the referral was for information-only, or the outcome was listed as "other."

Note: The "Other Disabilities" category includes children with emotional disturbance, deafness, deaf-blindness, hearing impairment, intellectual disability, multiple disabilities, orthopedic impairment, other health impairments such as chronic medical conditions that affect a child's ability to participate in the educational setting, traumatic brain injury, or visual impairment.

Additional data tables related to *Early Learning* can be found in Appendix 1 of this report.

CHILD HEALTH

CHILD HEALTH

Why it Matters

The physical and mental health of both children and their caregivers are important for optimal child development and well-being. Early childhood health, and even maternal health before pregnancy, has lasting impacts on an individual's quality of life. ^{221, 222} Experiences during the prenatal and early childhood periods can result in lifelong impacts on immune functioning, brain development and risk for chronic diseases. ^{223, 224} Poor health in childhood can also result in lower educational attainment and socioeconomic status in adolescence, adulthood and even inter-generationally. ^{225, 226} Therefore, adequate access to preventive care and treatment services is vital to support a child's long-term health, development and success. ^{227, 228, 229}

What the Data Tell Us

Access to health services

Health insurance coverage is an important indicator of whether families can access, afford and utilize medical care. In Arizona, children up to age 19 can enroll in health insurance through the Arizona Health Care Cost Containment System (AHCCCS), Arizona's Medicaid program. Children whose families earn too much for AHCCCS but do not earn enough to afford private health insurance may also be enrolled in KidsCare, Arizona's Children's Health Insurance Program. XXIX During the COVID-19 pandemic, uninsured rates declined due to federal policies prohibiting states from disenrolling people from Medicaid. Despite these efforts, uninsured rates in the overall population are still high. One primary reason for this is perceived cost, with more than two-thirds (69.6%) of uninsured U.S. adults citing their inability to pay for health insurance as the primary reason they were uninsured. Families who qualify for low- or no-cost health insurance may not be aware that they qualify, or they may face administrative barriers to enrolling.

A variety of health outcomes for both mothers and infants depend on access to quality health care and support before, during and after pregnancy. Early initiation of prenatal care reduces the risk of smoking during pregnancy, pregnancy complications, xxx premature births and maternal and infant mortality. 234, 235, 236, 237, 238 Poor access to maternal health care (e.g., hospitals with labor and delivery units, birth centers and obstetric health providers) is one factor that can contribute to these outcomes. 239, 240, 241 Black, Hispanic, American Indian and Alaska Native people experience a disproportionate lack of access to quality health care and support for their pregnancies. 242, 243 Lack of access to this care has

88 Yuma

-

xxix For more information on AHCCCS and KidsCare see: https://www.azahcccs.gov/Members/GetCovered/Categories/KidsCare.html

xxx One such complication is congenital syphilis, where untreated maternal syphilis is passed to the fetus and can lead to stillbirth or infant death. The number of babies born in Arizona with congenital syphilis increased more than 10-fold in the last 6 years, even though congenital syphilis can be prevented with adequate prenatal care. For more information, see:

https://www.azdhs.gov/preparedness/epidemiology-disease-control/disease-integration-services/std-control/congenital-syphilis/index.php

contributed to considerably higher rates of low birth weight births, preterm births and maternal and infant mortality compared to non-Hispanic White Americans. 244, 245, 246 Efforts to increase the number of women in Arizona with access to early prenatal care, such as expanding access to telehealth care and midwifery care, could improve the health outcomes of the state's mothers and babies, especially in counties with lower access to maternal health care services. 247

How the Yuma Region is faring

- In the Yuma Region, more than one in eight people (13%) do not have health insurance coverage, slightly higher than the proportion across the state of Arizona overall (11%) (Table 25).
- Health insurance coverage for young children specifically is higher than that of the overall population in the region, with only 7% of children birth to age 5 not having health insurance, the same as the proportion seen across the state (7%). The proportion of young children without health insurance has decreased in the region in recent years from 11% in 2012-2016 ACS to 7%, 2017-2021 ACS and to a greater degree than across the state (8%, 2012-2016 ACS; 7%, 2017-2021 ACS) (Table 25 & Figure 51).
- The proportion of births in the region paid for by AHCCCS or the Indian Health Services (IHS, which covers less than 0.5% of births in the Yuma Region) has decreased from 63% in 2018 to 58% in 2022 yet remained above the state proportions across those years. This proportion has also decreased in the state over those years, from 51% to 47% (Figure 52).
- Rates of timely prenatal care have fluctuated in the Yuma Region in recent years but decreased overall between 2018 and 2022. The region consistently had a lower proportion of births to mothers who began prenatal care in the first trimester compared to Arizona between 2018 and 2022, with 60% in that category in the region in 2022, compared to 71% across the state. In addition, the region had a higher proportion of births to mothers with inadequate prenatal care over those years, with 6.1% with no prenatal care at all and 6.6% with fewer than five visits if they did have prenatal care in 2022 compared to births across the state (2.3% and 4.7%, respectively) (Figure 53 & Figure 54).

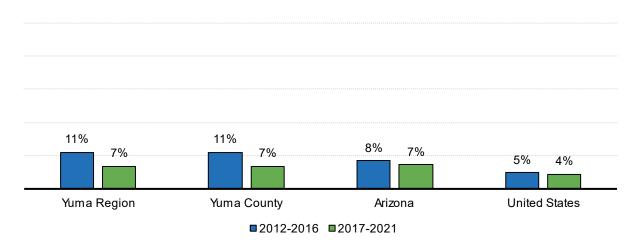

Table 25. Health insurance coverage, 2017-2021 ACS

Maternal age and substance abuse

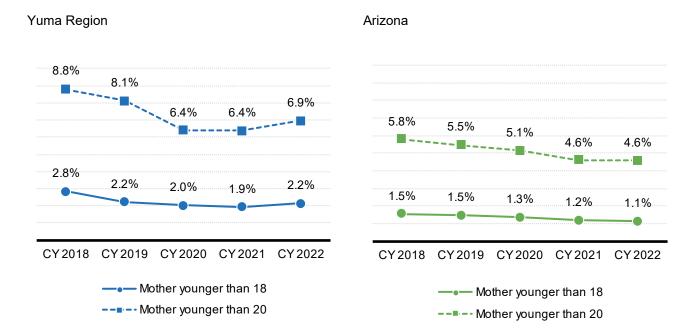

Infants' immediate and long-term health can be influenced by maternal characteristics including age and substance use during or after pregnancy. For example, teenage parents often experience increased stress and hardship in comparison to older parents and other non-parent teenagers as they are less likely to complete high school or college and more likely to maintain a lower socioeconomic status and require public assistance to make ends meet. ^{248, 249, 250, 251, 252}

The use of substances during pregnancy can cause negative health complications for fetuses and babies. For example, babies born to mothers who smoked cigarettes during pregnancy are more likely to be born preterm, have low birth weight, die from sudden infant death syndrome (SIDS) and have weak lungs. ^{253,254} The use of opioids, whether prescribed or illicit, during pregnancy also poses health risks to developing fetuses including preterm birth, stillbirth and birth defects. ²⁵⁵ It may also cause infants to experience withdrawal symptoms after birth, which is referred to as neonatal abstinence syndrome (NAS). Symptoms of NAS include sleep problems, seizures, poor feeding, dehydration, loose stool, sweating, tremors and vomiting. However, suddenly stopping opioid use while pregnant is also dangerous for both mothers and their fetuses, so access to knowledgeable health care providers and appropriate treatment options are vital for protecting both maternal and fetal health. ²⁵⁶

How the Yuma Region is faring

- The region and state have seen a slight decrease in the proportion of births to teenaged mothers overall between 2018 and 2022. Births to mothers under age 20 fell from 8.8% in 2018 to 6.9% in 2022 in the Yuma Region, slightly higher than the proportions across Arizona (5.8% in 2018; 4.6% in 2022) (Figure 55).
- The Yuma Region has a low percentage of births to mothers who smoked cigarettes while pregnant, and this proportion decreased from 2.1% in 2018 to 1.7% in 2022. The proportion of births to mothers who smoked cigarettes in the region was lower than across the state from 2018 to 2022 and the regional proportions across all those years met the Healthy People 2030 target of 4.3% or less (Figure 56).
- Between 2018 and 2022, 236 newborns in the region were hospitalized because of maternal drug use during pregnancy, with an average length of stay of 9.7 days (Table 26). In the region this equates to 1.6 newborns hospitalized due to maternal drug use during pregnancy per 100 live births, slightly below the rate of 3.3/100 statewide.

Table 26. Newborns hospitalized because of maternal drug use during pregnancy, 2018-2022 combined

Geography	Newborns hospitalized	Average length of stay (days)
Yuma Region	236	9.7
Yuma County	281	10.3
Arizona	12,939	9.5

Source: Arizona Department of Health Services (2023). [Hospital Discharge dataset]. Unpublished data.

Note: Data on newborns hospitalizations were geocoded to FTF regions using the address provided by parents at the time of hospitalization; however, in cases where the address provided was not valid, hospitalizations could not be assigned to a region. County of residence is captured separately from addresses, meaning that counts in the county often exceed those seen in a particular region because they include all newborns regardless of address validity.

Maternal health and well-being

CY 2018

A pregnant woman's health and well-being are closely linked to infant and child health and development. Gestational diabetes (i.e., diabetes that only presents during the pregnancy) increases the likelihood of an infant having low blood sugar, being born preterm, being larger than average at birth, needing to be delivered through cesarean section and even developing type 2 diabetes and

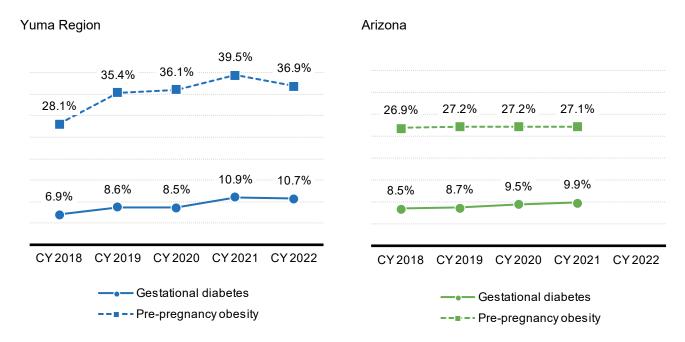

cardiovascular diseases later in life. ^{257, 258} Children of mothers categorized as having maternal obesity have increased risk of birth complications, asthma, diabetes, heart disease and neonatal and infant mortality. ^{259, 260, 261} A variety of social determinants of health have been linked to the development of diabetes and obesity, including low socioeconomic status, employment struggles, lack of health insurance and living in rural areas with fewer resources. ^{262, 263, 264, 265} Risks associated with these conditions can be reduced through increased access to maternal health care before, during and after childbirth as well as planning high-risk deliveries at hospital facilities with more resources and technical expertise. ^{266, 267}

Postpartum depression has a clear link to negative outcomes in infant health and development. Untreated postpartum depression can lead to infant sleeping, eating and behavioral problems, issues with maternal and infant bonding and infant developmental delays. ^{268, 269} Groups that have higher rates of postpartum depression include American Indian and Alaska Native mothers, mothers who are under age 19 and mothers who smoked during or after pregnancy. ²⁷⁰ The United States Preventive Services Task Force and the American Congress of Obstetricians and Gynecologists recommend assessing mothers' mental health both during pregnancy and after giving birth to facilitate early identification and intervention. ²⁷¹ In 2022, AHCCCS implemented a policy requiring depression screenings during prenatal and postpartum visits as well as well-child visits within the first 6 months of an infant's life for all enrolled mothers in Arizona. ²⁷² Mothers who screen positively for depression must be referred to a case manager or treatment services. ²⁷³ These screenings, as well as the ability to bill AHCCCS for the cost of screenings, will hopefully increase the likelihood that mothers experiencing postpartum depression are referred to appropriate mental health services.

How the Yuma Region is faring

- More than a third of births in the region and a quarter of births in the state in recent years were to mothers with pre-pregnancy obesity, and this proportion increased in the region from 28.1% in 2018 to 36.9% in 2022. The proportion of births to mothers with gestational diabetes has also increased in the region from 6.9% in 2018 to 10.7% in 2022, and in 2021 was just above the proportion of women giving birth who had gestational diabetes across Arizona (9.9%; 2021 is the latest state-level data available) (Figure 57).
- More than one in 10 mothers in Arizona (13.7%) reported experiencing post-partum depression in 2020 according to the Pregnancy Risk Assessment Monitoring System.²⁷⁴

Figure 57. Births to mothers diagnosed with gestational diabetes or pre-pregnancy obesity, 2018 to 2022

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.

Note: Mothers of twins are counted twice in this figure. Data on gestational diabetes and pre-pregnancy obesity were not available for Arizona in 2022.

Infant health

Infants who are born preterm or at a low birth weight have a higher possibility of short- and long-term health complications. Preterm birth is defined as birth at less than 37 weeks of gestation. Risks related to preterm births include respiratory, immune, neurological, vision, hearing and intestinal developmental issues. ²⁷⁵ Infants born preterm also have increased rates of mortality during their first 28 days to 1 year of life, longer hospitalization after birth, more health care costs and physical impairments. ^{276, 277} Preterm births are more likely among mothers who are under age 20, over the age of 35, low income, experience infections during pregnancy or engage in substance use. ²⁷⁸

Low birth weight is defined as weighing less than 5 pounds and 8 ounces (2,500 grams) at birth. Babies born in this condition have a higher risk of infant mortality and long-term health problems such as diabetes, hypertension and cardiac disease. ^{279, 280} Low birth weight risk factors include low maternal weight during pregnancy, preterm birth, teen pregnancy, pregnancy over the age of 35, high blood pressure, diabetes, substance use and air pollution. ²⁸¹

Newborns are admitted into neonatal intensive care units (NICUs) in hospitals for numerous reasons that can vary across medical providers and have implications for the short- and long-term health of babies and families. ²⁸² NICU stays can take a large emotional and financial toll on families, especially families living far from the hospital. Although NICU admissions may be an indicator of important health

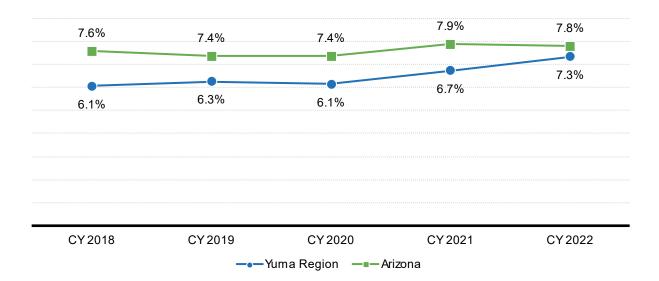

concerns in newborns, including low birth weight, they can also be a site of family-based interventions that can positively impact infant development and parent-child relationships.²⁸³

For parents who are able to breastfeed, the American Academy of Pediatrics recommends breastfeeding infants exclusively for the first 6 months after birth, followed by a combination of breastfeeding and other foods for up to 2 years or longer. ²⁸⁴ Breastfeeding offers a variety of benefits to infants due to the nutrition and antibodies that human breast milk provides. These benefits include lowering an infant's risk of type 1 diabetes, obesity, ear infections, SIDS, asthma and gastrointestinal infections. 285 Robust data on breastfeeding rates are only available for children served through the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) program.

How the Yuma Region is faring

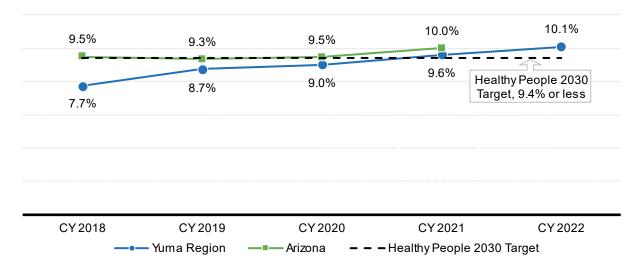

- The proportion of babies born at low birth weight in the region is just below the proportion across the state, with 7.3% of births at low birth weight in the Yuma Region and 7.8% in Arizona in 2022. In the region, this proportion has increased slightly since 2018 (6.1%) (Figure 58).
- The proportion of preterm births (less than 37 weeks gestation) in the region was also just below the state in recent years with the region at 9.6% and the state 10% in 2021 (the most recent year that both data points are available). In 2022, 10.1% of births were preterm in the region, meaning that the region failed to meet the Healthy People 2030 target of 9.4% or fewer births before 37 weeks gestation. Between 2018 (7.7%) and 2020 (9%), the region met this target, indicating a increasing trend of preterm births in more recent years (Figure 59).
- Births with an admission to a NICU in the region have increased over the last five years and have risen above the rates seen across the state starting in 2019 (2018: region 7.3%; state 7.6% and 2021: region 9.5%; state 7.9%). In 2022, 9.6% of births in the region had a NICU admission (data at the state level were unavailable) (Figure 60).
- In the Yuma Region, rates of breastfeeding were similar to those across the state between 2018 and 2020, before increasing above state rates in 2021 and 2022. In 2022, 84% of WIC-enrolled infants in the region were ever breastfed, compared to 79% statewide (Figure 61).

Childhood infectious disease and immunization

Immunization against preventable diseases protects both children and the surrounding community from potential illness and death. Immunization protects not only the vaccinated person but also individuals who are unable to be vaccinated, through "community immunity." In order to attend state-licensed child care programs and public or charter schools, children are required to receive specific vaccinations or obtain an official exemption, which can be requested for medical, personal or religious reasons. Statewide and nationally, childhood immunization rates have been declining in recent years. The COVID-19 pandemic exacerbated disparities in health care access, including routine immunizations, that specifically impacted children who are Black, Hispanic, low-income, live in rural areas or lack health insurance. National survey data from the Pew Research Center also show that declining childhood immunization rates, particularly for measles, mumps and rubella (MMR), can be linked to parents' shifting attitudes towards vaccines. While the majority of U.S. parents continue to express confidence in the value of childhood vaccination for MMR, a sizable proportion expressed concerns about the necessity of vaccines and showed declining support for vaccine requirements for children to attend public schools. Separate contents and showed declining support for vaccine requirements for children to attend public schools.

Respiratory syncytial virus (RSV) and influenza (flu) are leading causes of serious illness in young children, and following the onset of the COVID-19 pandemic in 2020, recent flu and RSV seasons have been more severe nationwide. PSV is the most frequent cause of hospitalization in children under 1 year of age. PSV In 2023, two new preventative therapies for RSV were approved—a single-dose antibody medication for infants, and an adult immunization for pregnant people administered in the third trimester of pregnancy. These new treatments have the potential to prevent severe illness in infants and young children, but shortages of the antibody medication have led the Centers for Disease Control and Prevention (CDC) to recommend prioritizing access for the highest-risk infants. This includes infants under 6 months of age, those with underlying health conditions such as lung or heart disease and American Indian or Alaska Native infants under 8 months of age, as well as older American Indian or Alaska Native infants who live in remote areas with limited access to health care facilities. The flu can also cause serious illness in young children under age 5, particularly for children birth to age 2, who are the most likely to be hospitalized with flu complications. The American Academy of Pediatrics recommends that all children ages 6 months and older be vaccinated against influenza each year.

How the Yuma Region is faring

• Across all required immunizations, children in child care in the Yuma Region had higher vaccination rates (DTaP^{xxxi} 94.6%; Polio 95.9%; MMR 97.3%) than the state as a whole (DTaP 90.6%; Polio 92.2%; MMR 93%) in the 2022-23 school year. Both the Yuma Region and state also met the Healthy People 2030 DTaP immunization target of 90% (Table 27).

xxxi The DTaP vaccine immunizes against Diphtheria, Tetanus and Pertussis.

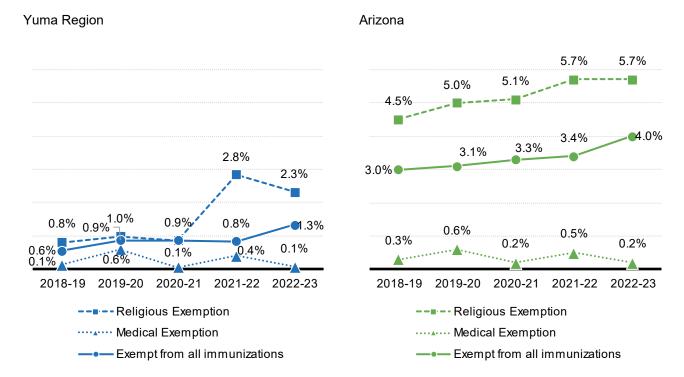

- Immunization exemptions among children in child care have been notably lower in the region than the state since the 2018-19 school year, with the regional rate of children receiving exemptions from all required vaccines about one third of the statewide rate in the 2022-23 school year (1.3% compared to 4%). Religious exemptions increased in the region overall between the 2020-21 and 2022-23 school years but remained below those seen across the state. In the 2022-23 school year, 2.3% of children in child care in the region received religious exemptions, compared to 5.7% across the state. Medical exemptions from immunizations in child care are uncommon in both the region and state, with only 0.1% of children in child care in the region and 0.2% in the state receiving medical exemptions during the 2022-23 school year (Figure 62).
- The Yuma Region also had higher kindergarten immunization rates in the 2022-23 school year (DTaP 95.3%; Polio 96.1%; MMR 95.7%) compared to the state (DTaP 89.6%; Polio 90.3%; MMR 89.9%). The region met the Healthy People 2030 kindergarten MMR immunization target of 95%, which the state did not (Table 28). Regional immunization rates may be high enough to assure community immunity of preventable infectious diseases. For example, 95% of children need to be vaccinated to create herd immunity in order to protect communities and achieve and maintain measles elimination. ²⁹⁸
- The Yuma Region also had notably lower rates of children in kindergarten receiving personal belief exemptions and exemptions from all required vaccinations between the 2018-19 and 2022-23 school years than across the state. During the 2022-23 school year, 2.6% of children in kindergarten received a personal belief exemption in the region compared to 7.3% of children statewide, and 1.8% of children in kindergarten in the region received exemptions from all required vaccines compared to 4.6% statewide. Medical exemptions from immunizations were similar in the region and state between the 2018-19 and 2022-23 school years, and these types of exemptions are much less common in both the region and the state (Figure 63).
- The pattern of confirmed and probable cases of RSV and influenza in young children birth to age 5 were similar in both the region and state with an increase in RSV cases since 2020, but a marked decrease in influenza in 2021, followed by a steep increase. In 2022, there were 136 cases of RSV and 137 cases of influenza in young children in the region, much higher numbers than the previous year (87 RSV; <6 influenza) (Figure 64).

Infant and child hospitalization and mortality

Infant mortality refers to the death of infants under 1 year of age. Some of the most common causes of infant mortality in Arizona and the U.S. include congenital abnormalities, low birth weight, preterm birth, pregnancy complications, SIDS and unintentional injuries. 299, 300, 301 According to provisional CDC data, infant mortality increased between 2021 and 2022 by 3% nationally, 13% in Arizona for all infants, and 21% for American Indian or Alaska Native infants nationwide, the highest increase seen for any group. 302 In addition to increasing, the infant mortality rates for American Indian or Alaska Native (9.1 deaths per 1,000 live births) and Black infants (10.9) were also notably higher than White (4.5) or Hispanic (4.9) infants in 2022, racial disparities that have been linked to maternal care deserts, which are particularly prevalent on tribal lands. 303 This indicates a serious need to increase access to timely prenatal care, newborn screening and home visiting programs in rural and tribal areas to begin to reduce infant mortality rates. 304

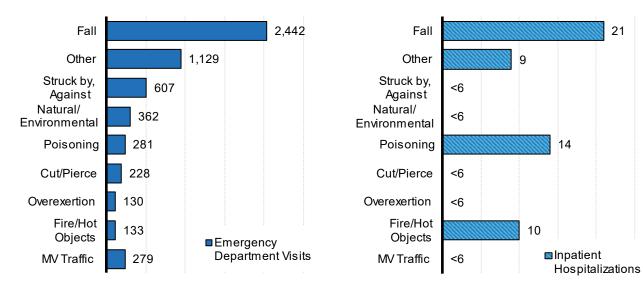

The leading cause of death for children birth to age 17 in the United States is unintentional injuries. 305 The most prevalent accidental injuries are car crashes, drowning, falls, suffocation, fires and poisoning. 306 Death from unintentional injuries is more common in children living in rural areas, as well as among American Indian and Alaska Native children. 307, 308 Increased awareness and safety precautions have helped reduce childhood deaths in the last decade, including child swimming lessons, proper infant sleeping position, installing smoke detectors, keeping medications out of reach, practicing gun safety and utilizing seatbelts and helmets. 309

How the Yuma Region is faring

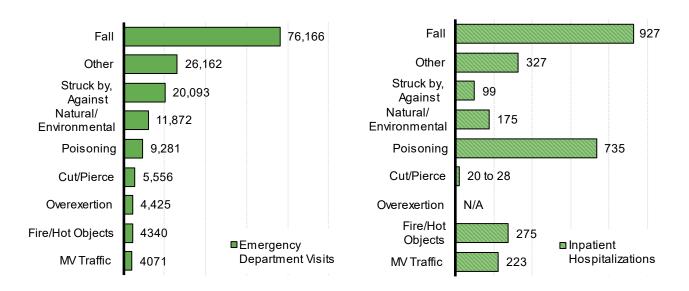

- Falls were the most common unintentional injuries that led to emergency department visits for children under 5 in both the region and the state between 2018 and 2022, followed by 'other' injuries and being 'struck by or against' an object or person. During those years, there were 2,442 emergency department visits due to falls in the region, 1,129 for other reasons and 607 due to being struck. The two most common injuries prompting inpatient hospitalizations were the same for the region and state, with falls being most common followed by poisoning. In the region, fire or hot objects were the third most common cause of inpatient hospitalizations followed by 'other' injuries, whereas across the state, 'other' injuries were the third most common injuries prompting inpatient hospitalizations. Between 2018 and 2022, 21 young children in the region were hospitalized due to falls, 14 for poisoning and 10 due to fire or hot objects (Figure 65).
- Between 2019 and 2021, the infant mortality rate was higher in the Yuma Region (6.9), compared to the state (5.4); neither the region nor the state rate met the Healthy People 2030 target of 5.0 or less (Figure 66).
- Overall, 124 children birth to age 17 died in the Yuma Region between 2018 and 2021. Just over one in six deaths (18%) were due to congenital malformations, with accidents being the second most common cause of death (17%). The third leading cause of death in the region, maternal complications, accounted for almost one in 10 deaths (9%), and the fourth leading cause, low birth weight, accounted for 7% of deaths of children under 18. This means that one in three child deaths in the region were due to conditions related to maternal and infant health. Across the state, the top four causes of death of children under 18 were accidents (20%), congenital malformations (15%), low birth weight (9%), and intentional self-harm or suicide (6%). In Arizona, maternal complications accounted for only 2% of these deaths across the state, compared to the much larger proportion of 9% in the Yuma Region (Figure 67).

Note: The leading causes of child death in Arizona are accidents (20%), congenital malformations (15%), low birthweight (9%), intentional self-harm/suicide (6%), and cancer/malignant neoplasms (5%). Causes of death in this figure are ordered by the leading causes of death in the region.

Additional data tables related to *Child Health* can be found in Appendix 1 of this report.

FAMILY SUPPORT AND LITERACY

FAMILY SUPPORT AND LITERACY

Why it Matters

Children's long-term well-being and success is tied to their relationships and experiences with their caregivers. Adverse childhood experiences (ACEs) refer to childhood experiences of abuse, neglect and other life events that can negatively impact children's immediate and long-term well-being. xxxii,310 ACEs have been associated with negative effects on development, educational achievement, future employment, mental health, drug and alcohol use and overall increased health care utilization. 311, 312, 313 ACEs are more prevalent among Arizona children with special health care needs and children living in poverty.³¹⁴

Social, physical, academic and economic outcomes are positively influenced by healthy relationships and interactions with family members and caregivers during childhood. 315, 316, 317, 318, 319 An understanding of, and ability to utilize, positive parenting skills is an important protective factor that reduces the likelihood of abuse and neglect, leading to better childhood and long-term outcomes.³²⁰ Positive Childhood Experiences (PCEs), including positive parent-child relationships and feelings of safety and support, have been shown to have positive long term impacts on mental and relational health.³²¹ Even if children have experienced multiple ACEs, if their families show high levels of resilience and connection (e.g., working together to solve problems, staying hopeful in difficult times and talking together about things that matter to their family) they show higher rates of flourishing, characterized by healthy social and emotional development and an open and engaged approach to learning. 322 These higher flourishing scores coupled with higher ACE scores point to the reality that childhood flourishing can, and does, exist amid adverse experiences and can potentially help mitigate their negative health effects.³²³ Supporting families with the knowledge and skills to promote resilience and connection can therefore be critical for ensuring children's long-term well-being.

What the Data Tell Us

Early literacy

Parents and families can play an important role in promoting early academic skills. When families read, sing and tell stories together, it can help young children develop reading and writing fluency as well as their capacity for reading comprehension. 324, 325, 326 Literacy practices at home have also been found to increase children's motivation to learn.³²⁷ These early literacy skills are important because they are linked to durable outcomes including elementary school performance and overall educational achievement.³²⁸

xxxii ACEs include eight categories of traumatic or stressful life events experienced before the age of 18 years. The eight ACE categories are sexual abuse, physical abuse, emotional abuse, household adult mental illness, household substance abuse, domestic violence in the household, incarceration of a household member, and parental divorce or separation.

Some families may face challenges to implementing literacy practices with their young children, especially when they are low-resourced. Barriers include being unfamiliar with child development benchmarks, having limited free time to spend with children and lower access to books in the home. Community programs, family resource centers, home visitation and larger-scale initiatives can help caregivers implement home-based literacy practices to improve children's reading scores. Recognizing the influence caregivers can have, the American Academy of Pediatrics suggests that pediatricians provide information to families about the benefits of early literacy practices. Doctor's offices and other community locations are also places where initiatives like Read on Arizona and Reach Out & Read may provide books and other materials that families can bring home.

Substance use disorders

Parental substance use has major implications for children's health and well-being. Children of parents with substance use disorders are frequently referred to child welfare services due to neglect or abuse and face a higher risk of later mental health and behavioral health issues, including developing substance use disorders themselves. 331, 332 Access to treatment for substance use disorders and supports for parents and families grappling with these issues can help ameliorate the short and long-term impacts on young children. 333, 334

How the Yuma Region is faring

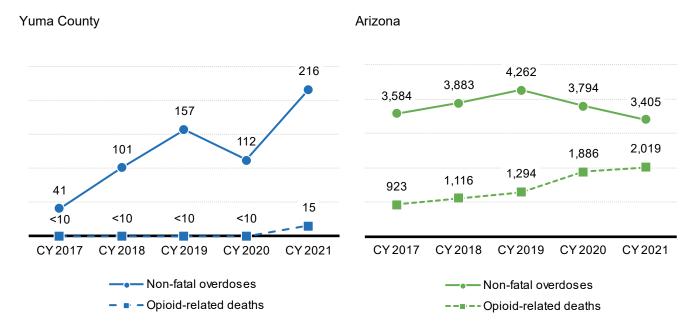

• The number of non-fatal opioid-related overdoses have increased in Yuma County overall since 2017 – from 41 that year to 216 in 2021. This increase runs counter to an overall decrease seen across the state during those same years. Overdose related deaths have increased markedly in past years across the state, and to a lesser degree in the county with less than 10 deaths in the county each year between 2017 and 2020 before increasing to 15 opioid-related deaths in the region in 2021 (Figure 68). To help address opioid addiction, the state of Arizona has made three resources available in recent years; the Opioid Assistance and Referral xxxiii line launched in 2018, no cost availability of naloxone (also called Narcan, a medication that rapidly reverses opioid overdose) to many organizations across the state through the Arizona Department of Health Services (ADHS) xxxiv and access to naloxone without a prescription at pharmacies.

110 Yuma

Source: Arizona Department of Health Services (2021). [Opioid-related vital statistics dataset]. Unpublished data.

Child removals

In situations where the harm in remaining with their family is determined to be too great to a child, they may be removed from their home, either temporarily or permanently. Since 2014, the number of children removed from their home by the Arizona Department of Child Safety (DCS) was nearly cut in half, from 12,162 children (birth to age 17) in 2014 to 6,689 in 2022. 335, 336, 337 This major reduction in removals is tied to multiple intentional efforts by DCS over the past decade to improve Arizona's child welfare system and safely reduce the number of children in foster care. 338, 339, 340

One notable effort was the work to better define instances of neglect and reduce unnecessary investigations of families. After a 2015 review found that DCS hotline staff lacked clear guidelines for determining cases of neglect, DCS provided coaching for hotline staff and developed an improved decision-making protocol with clearer guidance. This resulted in screened-in cases declining from 70% to 55%, 341

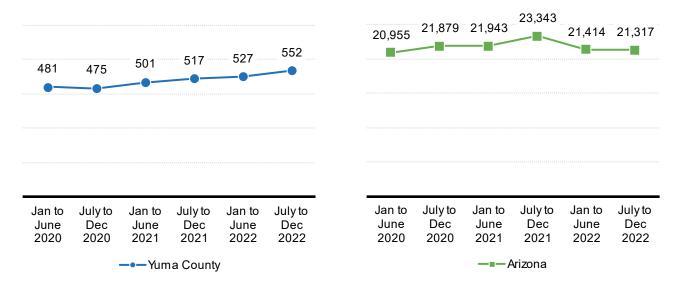

In March 2022, Arizona also passed legislation (SB 1050) which created a stricter definition of 'neglect,' reducing the risk that children are separated from their families simply for living in poverty. 342, 343 Despite removals declining, Black and American Indian children continue to be overrepresented in the DCS system. Addressing this disproportionality of Black and American Indian children in the DCS system is another area of targeted effort by the agency. In June 2023, Mathematica published the Arizona Department of Child Safety Next Event Study, which aimed to identify disparities in DCS engagement and provide recommendations to further reduce unnecessary investigations and

removals.³⁴⁴ DCS has developed several strategic initiatives to reduce these disparities, including implementing standardized training for staff and increasing involvement of family and community members in decision-making processes.³⁴⁵

How Yuma Region is faring

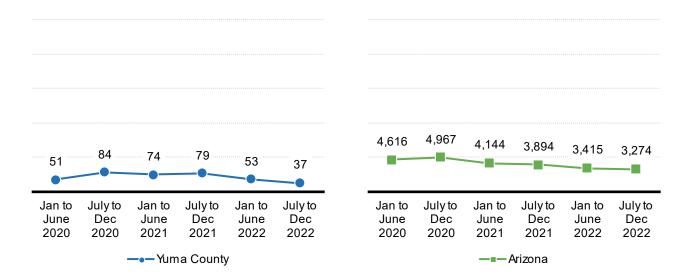

- The number of child abuse and neglect reports assigned for investigation by DCS increased overall in Yuma County and across the state between the first six months of 2020 and the last six months of 2022. However, as numbers across the state began to decrease after a high in the latter half of 2021, numbers continued to rise in Yuma County. In the last half of 2022, there were 552 child abuse and neglect reports assigned for investigation in the county (Figure 69).
- The number of children under 18 removed by DCS decreased overall in Yuma County and across the state between January 2020 and December 2022. A low of 37 children were removed by DCS in the county in the last six months of 2022. Neglect was the most common type of substantiated maltreatment during this period in both the county (87%) and state (71%), followed by physical abuse (13% and 24%, respectively) (Figure 70 & Figure 71).

Foster care

The Family First Prevention Services Act, signed into federal law on February 9, 2018, aims to ensure children are placed in the least restrictive, most family-like setting appropriate to their unique needs when foster care is needed. One effect of the Family First Prevention Services Act has been an increased focus on kinship placements, which are placements of children with relatives or close family friends.³⁴⁶ In recent years, the number of unlicensed kinship homes has even exceeded the number of foster homes in the state. This increase is likely related to several changes at DCS, including efforts to reduce barriers

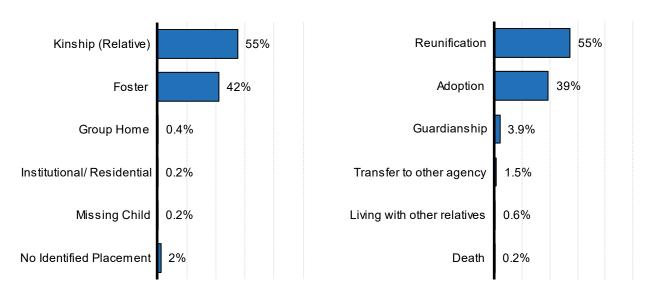

to licensure (e.g., waiving some fingerprint clearance card requirements) and funds to assist kinship caregivers with meeting licensing requirements (e.g., purchasing car seats). Additionally, an increase in the monthly kinship stipend (from \$75/month to \$300/month) for unlicensed kinship homes can help support relatives, such as grandparents, who are caring for children even if they are not currently able to pursue becoming a licensed foster home. ³⁴⁷

How Arizona is faring

- In the last six months of 2022, over half (55%) of young children birth to age 5 placed in out-of-home care by DCS across Arizona were able to remain with family through a kinship placement. Children in DCS custody most often exited out-of-home care to be reunified with their parents (55%) or adopted (39%) (Figure 72).
- The number of licensed kinship foster homes in Arizona steadily declined between January 2018 and June 2022, though there was an uptick again in the latter half of 2022. Generally, fewer than one in five kinship homes are licensed, and the number of unlicensed kinship homes increased slightly overall during the same period and exceeded the number of community foster homes during the first years of the pandemic (Figure 73).

Note: The five percentages in each row should sum to 100%, but may not because of rounding. Mothers who report more than one race or ethnicity are assigned to the one which is smaller. Mothers of twins are counted twice in this table.

Table 33. Children birth to age 5 living with parents who are foreign-born, 2017-2021 ACS

Geography	Estimated number of children (birth to 5 years old) living with one or two parents	Number and percent living	with one or two foreign-born parents
Yuma Region	15,811	5,688	36%
Yuma County	15,935	5,723	36%
Arizona	473,732	115,267	24%
United States	22,399,131	5,504,770	25%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B05009

Note: The term "parent" here includes stepparents.

Table 34. Language spoken at home (by persons ages 5 and older), 2017-2021 ACS

Geography Yuma Region	Estimated population (age 5 and older) 187,806	Speak only English at home 46%	Speak Spanish at home 53%	Speak languages other than English or Spanish at home 2%
Yuma County	188,662	46%	53%	2%
Arizona	6,666,597	73%	20%	6%
United States	310,302,360	78%	13%	8%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in each row may not sum to 100% because of rounding. The American Community Survey (ACS) no longer specifies the proportion of the population who speak Native North American languages for geographies smaller than the state. In Arizona, Navajo and other Native American languages (including Apache, Hopi, and O'odham) are the most commonly spoken (2%), following English (73%) and Spanish (20%).

Table 35. English-language proficiency (for persons ages 5 and older), 2017-2021 ACS

Geography Yuma Region	Estimated population (age 5 and older) 187,806		Speak another language at home, and speak English very well	Speak another language at home, and do not speak English very well 20%
Yuma County	188,662	46%	34%	20%
Arizona	6,666,597	73%	18%	8%
United States	310,302,360	78%	13%	8%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in each row should sum to 100%, but may not because of rounding.

Table 36. Limited-English-speaking households, 2017-2021 ACS

Geography	Estimated number of households	Number and percent	of limited-English-speaking households
Yuma Region	72,341	7,665	11%
Yuma County	72,716	7,767	11%
Arizona	2,683,557	99,159	4%
United States	124,010,992	5,241,326	4%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16002

Note: A "limited-English-speaking" household is one in which no one over the age of 13 speaks English very well.

Table 37. Grandchildren birth to age 5 living in a grandparent's household, 2020 Census

Geography	Estimated number of children (birth to 5 years old) living in households		ing in their grandparent's household
Yuma Region	15,249	2,653	17%
Yuma County	15,312	2,670	17%
Arizona	480,744	64,792	13%
United States	22,401,565	2,520,305	11%

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P14, PCT11.

Note: This table includes all children (under 6 years old) living in a household headed by a grandparent, regardless of whether the grandparent is responsible for them, or whether the child's parent lives in the same household.

Economic Circumstances

Table 38. Median annual family income, 2017-2021 ACS

Geography	Median annual income for all families	Median annual income for all families with children under 18 years old	income for married- couple families with children under 18	Median annual income for single- male-headed families with children under 18 years old	Median annual income for single- female-headed families with children under 18 years old
Yuma County	\$58,600	\$53,800	\$72,500	\$34,100	\$25,900
Arizona	\$78,800	\$75,100	\$100,000	\$49,100	\$35,000
United States	\$85,000	\$82,800	\$110,000	\$50,900	\$32,600

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B19126

Note: Half of the families in the population are estimated to have incomes above the median value, and the other half have incomes below the median.

Table 39. Children birth to age 5 living at selected poverty thresholds, 2017-2021 ACS

Geography	Estimated number of children (birth to 5 years old) who live with parents or other relatives	Percent of children under 50% of the poverty level	Percent of children between 50% and 99% of the poverty level	Percent of children between 100% and 184% of the poverty level	Percent of children at or above 185% of the poverty level
Yuma Region	16,179	13%	13%	27%	47%
Yuma County	16,304	13%	13%	27%	47%
Arizona	486,513	9%	11%	19%	61%
United States	22,940,195	9%	10%	16%	65%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17024

Note: The four percentages in each row should sum to 100%, but may not because of rounding. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677. The 185% thresholds are \$50,836 and \$34,552, respectively.

Table 74. Non-fatal hospitalizations and emergency department visits due to unintentional injuries for children birth to age 5, 2018-2022 combined

Geography	Non-fatal inpatient hospitalizations for unintentional injuries	for unintentional injuries
Yuma Region Yuma County	67	5,541 5,572
Arizona	2,811	160,742

Source: Arizona Department of Health Services (2023). [Hospital Discharge dataset]. Unpublished data.

Note: Data on hospitalizations were geocoded to FTF regions using the address provided by parents or caregivers at the time of hospitalization; however, in cases where the address provided was not valid, hospitalizations could not be assigned to a region. County of residence is captured separately from addresses, meaning that counts in the county often exceed those seen in a particular region because they include all hospitalizations regardless of address validity.

Family Support & Literacy

Table 75. Number of deaths with opiates or opioids contributing, 2018-2021 combined

Geography	Number of deaths with opiates or opioids contributing, 2018-2021
Yuma Region	31
Yuma County	32
Arizona	6,315

Source: Arizona Department of Health Services (2023). [Vital Statistics dataset]. Unpublished data.

Note: About 35% of overdose deaths statewide were missing address information and thus could not be geocoded to an FTF region, but county assignments were available from death certificates.

APPENDIX 2: METHODS AND DATA SOURCES

U.S. Census and American Community Survey Data. The U.S. Census³⁴⁸ is an enumeration of the population of the United States. It is conducted every ten years, and includes information about housing, race, and ethnicity. The 2020 U.S. Census data are available by census block. There are about 108,000 inhabited blocks in Arizona, with an average population of 66 people each. The Census data for the Yuma Region presented in this report were calculated for most indicators by identifying each block in the region and aggregating the data across all of those blocks. With the implementation of new privacy measures by the U.S. Census, some data previously available at the block level, such as grandchildren living in a grandparent's households or counts of households with children birth to age 5, are now only published at the block group or tract level. Regional estimates for these indicators were calculated by aggregating data over the census tracts which are wholly or partially contained in the region. Data from partial census tracts were apportioned according to the percentage of the 2020 Census population in that tract living inside the region.

The American Community Survey (ACS)³⁴⁹ is a survey conducted by the U.S. Census Bureau each month by mail, telephone, and face-to-face interviews. It covers many different topics, including income, language, education, employment, and housing. ACS data are available by census tract. Arizona is divided into about 1,750 census tracts, with an average of about 3,900 people in each. The ACS data for the Yuma Region were calculated by aggregating over the census tracts which are wholly or partially contained in the region. The data from partial census tracts were apportioned according to the percentage of the 2020 Census population in that tract living inside the region. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2017 to 2021. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates.

Education Data from ADE. Education data from the Arizona Department of Education (ADE) included in this report were obtained through a custom tabulation of unredacted data files conducted by the vendor on a secure ADE computer terminal in the fall of 2023. The vendor worked with the regional director to create a list of all public and charter schools in the region based on the school's physical location within the region as well as local knowledge as to whether any schools located outside the region served a substantial number of children living within the region. This list was used to assign schools and districts to the region as well to aggregate school-level data to the region-level. This methodology differs slightly from the methods that ADE uses to allocate school-level data to counties, so county and region totals may vary in some tables. Data were presented over time where available; however, due to changes in the ADE data system as well as the effects of the COVID-19 pandemic on data collection and definitions over the past three years, some indicators could not be presented as a time series.

Child Care Capacity Calculations. Lists of child care providers are maintained by multiple state agencies in Arizona, including the Arizona Department of Health Services (ADHS), which licenses child care centers; the Arizona Department of Economic Security (DES), which maintains the Child

Care Resource and Referral (CCR&R) list; and First Things First (FTF), which administers the Quality First program. ADHS child care licensing database was used as the primary source for child care capacity calculations in this report, as analyses of both statewide and region-level data showed that most child care slots in regulated providers in the region are provided by centers. Centers that only serve children ages 5-12 were removed from child care capacity calculations, as these are typically before- & after-school programs that only serve school-age children. For all tables, providers were geocoded to regions using addresses or coordinates provided in the state agency datasets to assign them to regions. Comparisons of child care capacity to the young child population are meant to provide a relative assessment of the abundance or scarcity of child care supply relative to potential demand. The child care tables in this report do not reflect the capacity of unlicensed, unregulated or informal child care providers in the region. The estimated supply may also over-estimate availability in regulated care as it did not account for child care providers that operate under licensed capacity by choice or children who enroll in multiple facilities (e.g., a child who attends part-day Head Start or school-based preschool in the morning and a child care center in the afternoon).

Change Calculations. Unless otherwise specified, changes in counts of data over time (i.e., percent increase or decrease) are calculated by subtracting the earlier number (e.g., a 2010 count) from the later number (e.g. the 2020 count) and dividing the result by the earlier number (e.g. the 2010 count). This calculation provides the percent change between the most recent count and the prior count, relative to the prior count.

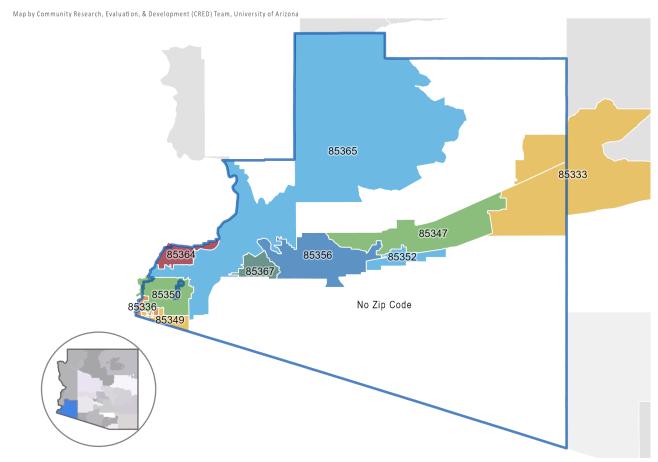

Data Availability. State agency data in this report were provided to FTF by agency staff through a data request process initiated in May 2023 and extending to January 2024. Wherever possible, data were requested for multiple years to allow for the visualization of trends as well as for the most recent year available. However, due to both the constraints of agency staff and agency-maintained datasets as well as the timing of requests, not all data were available on the same time and geographic scales. This report attempts to include the most recent and complete data available, with notes indicating where data were not available for particular time periods or geographies.

Data Suppression. To protect the confidentiality of program participants, the FTF Data Dissemination and Suppression Guidelines preclude our reporting of social service and early education programming data if the count is less than 10 and preclude our reporting data related to health or developmental delay if the count is less than 6. In addition, some data received from state agencies are suppressed according to their own guidelines. ADHS does not report counts between 1 and 5; DES does not report counts between 1 and 9; ADE does not report counts less than 11. Additionally, both ADE and DES require suppression of the second-smallest value or the denominator in tables where a reader might be able to use the numbers provided to calculate a suppressed value. Throughout this report, information which is not available because of suppression guidelines is indicated by entries of "1-5" or "1-9" or "<11" for counts, or "DS" (data suppressed) for percentages. Data are sometimes not available for particular regions, either because a program did not operate in the region or because data are only available at the county level. Cases where data are not available will be indicated by an entry of "N/A" or a table row note that states "regional data not available."

For some data, an exact number was not available because it was the sum of several numbers provided by a state agency, and some numbers were suppressed in accordance with agency guidelines or because the number was suppressed as a second-smallest value that could be used to calculate a suppressed value. In these cases, a range of possible numbers is provided, where the true number lies within that range. For example, for data from the sum of a suppressed number of children enrolled in Child-only Temporary Assistance for Needy Families Cash Assistance Program (TANF) and 12 children enrolled in a household with TANF, the entry in the table would read "13 to 21." This is because the suppressed number of children in Child-only TANF is between 1 and 9, so the possible range of values is the sum of the known number (12) and 1 on the lower bound to the sum of the known number (12) plus 9 on the upper bound. Ranges that include numbers below the suppression threshold of less than 6 or 10 may still be included if the upper limit of the range is above 6 or 10. Since a range is provided rather than an exact number, the confidentiality of program participants is preserved.

APPENDIX 3: ZIP CODES OF THE YUMA REGION

Figure 74. Zip Code Tabulation Areas (ZCTAs) in the Yuma Region

Source: Custom map by the Community Research, Evaluation, & Development (CRED) Team using shapefiles obtained from First Things First and the U.S. Census Bureau 2020 TIGER/Line Shapefiles (https://www.census.gov/cgi-bin/geo/shapefiles/index.php)

Table 78. Zip Code Tabulation Areas (ZCTAs) in the Yuma Region
