INTRODUCTION

Ninety percent of a child's brain growth occurs before kindergarten, and the quality of a child's early experiences impacts whether their brain will develop in positive ways that promote learning. Arizonans created First Things First (FTF) to help ensure that Arizona children have the opportunity to start kindergarten prepared to be successful. Understanding the critical role the early years play in a child's future success is crucial to our ability to foster each child's optimal development and in turn, impact all aspects of well-being in our communities and our state. This Needs and Assets Report for the FTF La Paz/Mohave Region helps us in understanding the needs of young children, the resources available to meet those needs and gaps that may exist in those resources.

The 2026 report has been redesigned in response to stakeholder feedback. The revised structure now consists of two parts: the primary report and supplementary sub-regional fact sheets.

The main report is structured around four domains relevant to young children, their families, and the professionals who support them in the region:

- Child, Family & Community Characteristics
- Early Education
- Education & Workforce
- Child Health & Development

This main report uses an infographic and figure-based approach to analyze regional-level data trends, as well as how these regional trends compare to statewide trends. Community-level data, illustrating similarities and differences within the sub-regions of the FTF La Paz/Mohave Region, is detailed separately in the Fact Sheets. The FTF La Paz/Mohave Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options in supporting the healthy development and education of young children in their care. It is our sincere hope that this information will help guide community conversations about how we can best support school readiness for all children in the FTF La Paz/Mohave Region. To that end, this information may be useful to local stakeholders as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to age 5 in communities throughout the region.

ACKNOWLEDGMENTS

The FTF La Paz/Mohave Regional Partnership Council wishes to thank all of the federal, state and local partners whose contributions of data, ongoing support and partnership with FTF made this report possible. These partners included the Arizona Departments of Administration (Employment and Population Statistics), Child Safety, Economic Security, Education and Health Services; Child Care Resource and Referral; Arizona Health Care Cost Containment System; and the U.S. Census Bureau. We also want to thank parents and caregivers, local departments and service providers and members of the public who provided local data, attended regional council meetings and voiced their opinions, as well as all the organizations working to transform the vision of the regional council into concrete programs and services for children and families in the FTF La Paz/Mohave Region. Lastly, we want to acknowledge the current and past members of the FTF La Paz/Mohave Regional Partnership Council whose vision, dedication and passion have been instrumental in improving outcomes for young children and families within the region. As we build upon those successes, we move ever closer to our ultimate goal of creating a comprehensive early childhood system that ensures children throughout Arizona are ready for school and set for life.

ABOUT THIS REPORT

The experiences in the first few years of a child's life lay the foundation for their future. Safe and healthy neighborhood environments, accessible educational opportunities, economically stable families and nurturing social contexts for young children have long-term, positive impacts. This Needs and Assets Report examines the current conditions for young children and their families—including social and economic contexts, early learning systems, education and workforce indicators, health outcomes and supports for children with special needs—in the First Things First (FTF) La Paz/Mohave Region.

Sources and Data: The data in this report come from a variety of sources including federal and state agencies and local agencies or service providers. Federal government sources include publicly available data from the 2020 Census and American Community Survey (ACS) 5-Year Estimates (primarily 2019-2023). The 2020 Census faced unprecedented challenges in data collection, the foremost of which was the COVID-19 pandemic and its disruption of local institutions. Due to these challenges, the 2020 Census is widely known to have undercounted young children and particular populations such as American Indians residing on reservations.¹ Data in this report from the ACS summarize the responses from samples of residents taken between 2019 and 2023. Because these estimates are based on samples rather than the entire population, ACS data should not be considered exact. Estimates for smaller geographies, such as

regions or sub-regions, are less accurate than estimates for larger geographies, such as the state, because they are based on smaller sample sizes.

Data were provided to FTF by state agencies including the Arizona Department of Health Services (ADHS) and the Arizona Department of Economic Security (DES). FTF strategy data related to quality early education, professional development and home visiting were also provided. FTF partnered with the Arizona State University Center for Health Information and Research (CHiR) to create custom tabulations of claims data for young children from the Arizona Health Care Cost Containment System (AHCCCS). In most cases, the data in this report were calculated specifically for the Needs and Assets process and are more detailed than the data that are published by these agencies for the general public. Whenever possible, this report will use data tailored to the region, but in some cases, there are only county-level or statewide data available to report. This report also includes publicly available data for the county and state, including from state agencies such as the Arizona Department of Commerce's Office of Economic Opportunity, Arizona Department of Education (ADE), and the Arizona Department of Child Safety (DCS) semi-annual child welfare reports. When more recent data from public or state agency datasets were not available, this report cites data from past Regional Needs and Assets Reports for the region.

The data in this report are as complete as possible, but there are cases when data for specific years were unavailable or unable to be reported. State agencies have varying policies about reporting small values. Labels such as <10, <6 or "DS" indicate that a count has been suppressed to protect privacy. When data were not available for a given year or geography, the label "N/A" is used.

Color-coding: This report uses color-coding to indicate the relevant geography for each number or percentage discussed in the text as follows: **La Paz/Mohave Region**, **La Paz County**, **Mohave County**, **Arizona**, and the **U.S.** Additional important numbers in the text that do not correspond to one of these geographies have been **bolded**.

Data Interpretation Session: The data compiled in this report reflect one way of knowing about the status of young children and their families, but local perspectives on what works well and what needs improvement from community experts who live, work and care for children in the region provide another vital source of information about the needs and assets in the region. First Things First Regional Partnership Council members and other key community experts participated in a facilitated data discussion in the beginning of 2026 to review the data included in this report. During this session, participants shared local knowledge and perspectives to help interpret the data and add additional context about the region. These insights are included throughout the report, attributed to "local key informants" and "local community experts."

Limitations: This report was compiled in the fall of 2025 and spring of 2026 during a time of rapid changes in federal funding and policy. The data presented reflect a particular moment in time. Where possible, potential impacts of currently known policy decisions grounded in high-quality research have been included, but the full extent of the impact of policies implemented in 2025 and 2026 on early childhood well-being will not be fully clear for years to come.

Throughout this report, state-level data is included to help understand how the region is doing in comparison to Arizona overall. For a more comprehensive discussion of needs and assets at the state level, please see the First Things First 2025 Statewide Needs and Assets Report – Building Bright Futures.^a

Analysis of data and reporting of findings contained in this report were completed by Kara Habersstock Tanoue, Rachel Leih, Madeleine deBlois, Deirdre Avery, Vicki Brown, Terrace Ewinghill, Rachel Gildersleeve, Anvi Bhakta, Beatriz Reyna, Deshawna Yazzie, April Horne, Lauren Moxley, Dora Valencia, Claudia Vega and Felicia Zhang from the Community Research, Evaluation & Development (CRED) team in the John and Doris Norton School of Human Ecology at the University of Arizona.

THE LA PAZ/MOHAVE REGION

The First Things First regional boundaries were established to create regions that (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments, (d) facilitate the ability to convene a Regional Partnership Council, and (e) allow for the collection of demographic and indicator data.

La Paz/Mohave Region is defined as the combined area of the two counties, not including the lands belonging to the Colorado River Indian Tribes, the Hualapai Tribe and the Kaibab Paiute Tribe. The region does include the Arizona portion of the land belonging to the Fort Mojave Indian Tribe, as this tribe has chosen to participate as part of the La Paz/Mohave Region. This decision must be ratified every two years, and the Fort Mojave Indian Tribe has opted to continue as part of the region, with the opportunity to be represented on the Regional Partnership Council. The region covers about 16,700 square miles, with its northern end separated from the rest by the Grand Canyon. The communities of the region are diverse in population density and in demographics and are often isolated by large areas of unpopulated land. People and services are

First Things First 2026 Needs and Assets Report

concentrated in larger places in the region such as Bullhead City, Kingman, Lake Havasu City and Parker.

The map below shows the geographical area covered by the La Paz/Mohave Region. Additional information is available at the end of this report, including a map and table of the region's zip codes and a map of Arizona public school districts in the region in the *Maps & Methods* Appendix.

FAMILY, CHILD & COMMUNITY CHARACTERISTICS

Young children in the region

While young children make up a small proportion of the overall population, their well-being has wide-reaching impacts on families, social service systems and the state's future population. Continued investment in children's well-being and the well-being of their families was deemed by the National Academy of Sciences as "the most efficient strategy" for strengthening the future workforce and supporting a thriving community.^{2,3} According to the 2020 Census, the La Paz/Mohave Region was home to about **10,689** young children birth to age 5. Between 2018 and 2023, births in the region saw small fluctuations, ranging from a low of **1,628** births in 2018 to a high of **1,829** births in 2021, declining to **1,728** births in 2023.^b Statewide, births declined from 2018 to 2020, before increasing again over the next two years, and ultimately declining in 2023.

Prior to more recent increasing trends in births in the region, the number of young children counted in the 2020 Census was notably lower than in 2010, decreasing by **21%** from **13,469** young children in 2010 to **10,689** in 2020. This decline was much larger than the rate observed statewide, where there was a **12%** decrease in the population of young children over the same ten-year period. This was also in contrast to the all-age population, which increased slightly in the region (**+4%**), though this growth was notably smaller than the **12%** increase in the overall population statewide.

Characteristics of young children and the population

According to the 2020 Census, approximately **221,221** people lived in the La Paz/Mohave Region, with **95,882** households. About one in twelve households (**8%**) in the region included a young child birth to age 5, a slightly lower proportion of households than across the state (**13%**) and U.S. (**13%**).

Understanding the racial-ethnic composition of communities can inform efforts to ensure equitable access to services and resources. According to the 2020 Census, most La Paz/Mohave Region residents identified as non-Hispanic White (**80%** of the total population, **66%** of young children birth to age 4). Young children in the region were more likely to be identified as Hispanic

^b Note that births are assigned to the region based on the address that parents list on the birth certificate form. This means that babies born to families residing in the region should be counted in regional birth numbers regardless of the location of the hospital where they were born.

Figure 1.

Young children in the region

³ U.S. Census Bureau. (2010). 2010 Decennial Census.

or Latino (**29%**) compared to the total population (**16%**). However, both proportions were lower than those observed statewide (**44%** of young children and **31%** of the total population).⁴ The vast majority (**91%**) of residents in the La Paz/Mohave Region spoke English as their primary language at home, a higher proportion than across the state (**74%**). The remaining **9%** of region residents spoke Spanish (**7%**) or another language (**2%**), lower proportions than across Arizona as a whole (**19%** and **6%**, respectively).⁵

Caregivers for young children

Family structure has important effects on children's development.⁶ For example, living in a single-parent household is often linked to implications for poverty, access to health and education resources, parental health and the quality of a child's interactions with adult caregivers.^{7, 8, 9, 10, 11, 12} The 2023 American Community Survey (ACS) estimated that just under half of children birth to age 5 in the La Paz/Mohave Region lived with two married parents (**45%**), lower than the proportion statewide (**60%**).¹³ A similar proportion of young children in the region resided with one unmarried parent^c (**43%**), a higher proportion than across the state (**36%**).

Multi-generational households, where grandparents, parents and children live together, are also becoming more common across all racial and ethnic groups.^{14, 15, 16, 17} These living arrangements can offer financial and social benefits, but also stressors such as differing parenting styles and family roles.^{18, 19, 20, 21, 22} According to the 2020 Census, **15%** of young children in the La Paz/Mohave Region lived in a grandparent's household, with or without a parent present. This proportion in the region equaled that across Mohave County (**15%**), was slightly lower than the proportion across La Paz County (**17%**) and was a higher proportion than across the state (**13%**) and nation (**11%**). Overall, there were **1,574** grandparents in the region who reported that they were responsible for one or more grandchildren birth to age 17.

Kinship care, where children live with someone other than their parents (such as grandparents, other relatives or close friends), may bring challenges related to informal guardianship (e.g., difficulties in registering children for school), coping with parental absence and being an aging caregiver for a young child.^{23, 24, 25, 26, 27, 28, 29} In the La Paz/Mohave Region, **5%** of young children resided with relatives other than parents (e.g., grandparent, aunt or uncle) and **7%** lived with a non-relative caregiver, notably higher than the rates seen statewide (**3%** with relatives and **2%** with non-relatives).³⁰

^c The term "parent" includes stepparents. Please note that due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one parent' category).

Figure 2.

Characteristics of young children and the population

¹ U.S. Census Bureau. (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC).

² U.S. Census Bureau. (2024). 2023 American Community Survey Five-Year Estimates, 2019-2023.

Notes: Race and ethnicity data are non-exclusive, meaning that individuals are counted in each category in which they identify. Language data are for the population ages 5 and older. The American Community Survey (ACS) no longer specifies the proportion of the population who speak Native North American languages for geographies smaller than the state. In Arizona, Navajo and other Native American languages (including Apache, Hopi, and O'odham) are the most commonly spoken (2%), following English (73%) and Spanish (20%).

Participation in the labor force can impact families in ways that affect children's health and well-being. For example, unemployment can limit access to resources that support children's physical and mental health.³¹ An estimated **85%** of young children birth to age 5 in the La Paz/Mohave Region lived in families with at least one parent in the labor force. More than half of all young children (**58%**) lived with all parents in the labor force, making it likely that these families need some form of child care.

Income and poverty among families with children

Poverty is associated with reduced access to nutrition, green space and health care and greater exposure to psychosocial stress and environmental toxins; together, these factors may have implications for children's growth and brain development.^{32, 33, 34} According to the U.S. Department of Health and Human Services, in 2025, a family of two adults and two children was considered to be in poverty if their income fell below \$32,150, while for a single parent with one child the threshold was \$21,150.³⁵ Between 2019 and 2023, an estimated **26%** of young children in the La Paz/Mohave Region lived in poverty, the same as the region's poverty rate between 2014 and 2018 (**26%**). Young child poverty rates in Mohave County increased slightly during this time (**26%** to **27%**), while young child poverty rates decreased in La Paz County (**44%** to **37%**), statewide (**25%** to **18%**), and nationwide during this time, a phenomenon largely attributed to pandemic relief funding and policies.³⁶

Overall, single-parent families across Arizona earned less than married-couple families in 2023. The married-couple family median income in La Paz County (**\$71,650**) was just over \$5,000 higher than the median income for single-male-headed families (**\$66,250**) but nearly 2.5 times more than for single-female-headed families (**\$28,673**). In Mohave County, the median income for married-couple families (**\$93,985**) was more than double the median income for single-male-headed families (**\$40,511**) and more than triple that of single-female-headed families (**\$31,214**). Across all family types, the median income in both counties was lower than median incomes statewide, with notably lower median incomes in La Paz County, with one exception – single-male-headed family median income in La Paz County (**\$66,250**) was higher than statewide (**\$57,566**).

While median family income is a measure of how much families earn, the self-sufficiency standard^d attempts to estimate how much families actually need to earn to fully support themselves. These standards vary by family type and differences in costs of housing, transportation, child care and other budget items across counties and states.^{37, 38} In 2022, the self-sufficiency standard for two parents, one preschooler and one infant was **\$71,928** in La Paz

^d For more information on the Arizona 2022 Self-sufficiency standard, please see https://womensgiving.org/wp-content/uploads/2022/12/AZ2022_SSS_Web.pdf

Figure 3.

Caregivers for young children

¹ U.S. Census Bureau. (2024). 2023 American Community Survey Five-Year Estimates, 2019-2023.

² U.S. Census Bureau. (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC).

Notes: The 4 percentages for living arrangements and employment status should sum to 100% but may not because of rounding. The term "parent" here includes stepparents. Due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one unmarried parent' category).

County and **\$70,127** in Mohave County. In La Paz County, the self-sufficiency standard was slightly higher than the median income for married couples with children (**\$71,650**), but in Mohave County this standard was notably lower than the median income for married couples with children (**\$93,985**). The self-sufficiency standard for one parent and one preschooler was **\$49,168** in La Paz County and **\$47,415** in Mohave County which exceeded the median incomes for single-female-headed families with children in both counties, but only for single-male-headed households in Mohave County (**\$40,511**). These data highlight the likelihood that many single parents in these counties may not be earning enough income to support their families.

The Arizona self-sufficiency standards were updated in 2025 and reflect a significant increase in the cost of basic needs across Arizona since they were first published in 2002.³⁹ Mohave County's self-sufficiency standards increased by **18%** for two parents, one preschooler and one infant (**\$82,464**) and **12%** for one parent and one preschooler (**\$53,210**) between 2022 and 2025. La Paz County had smaller, though meaningful, increases, increasing by **11%** for two parents, one preschooler and one infant (**\$79,710**) and **3%** for one parent and one preschooler (**\$50,410**).⁴⁰

These rising costs have real implications for families' well-being in the La Paz/Mohave Region. When housing costs consume a large percentage of family income, limited funds for basic needs such as food and utilities can influence young children's development.^{41, 42, 43} Traditionally, housing has been deemed affordable for families if it costs less than 30% of annual household income. Almost three in 10 households (**28%**) in the La Paz/Mohave Region were considered housing cost-burdened, spending 30% or more of their income on housing. This is lower than the **30.8%** of cost-burdened households statewide but the region did not meet the Healthy People 2030^e target of **25.5%** or fewer households with a high housing cost burden.⁴⁴

Internet access is a vital utility in homes in today's interconnected world. Reliable broadband enables access to education, employment, telehealth and social connection, highlighting its importance as a "super determinant" of health.⁴⁵ In the La Paz/Mohave Region, the vast majority (**96%**) of children under age 18 had access to a computer and internet at home. Taken together, relatively lower rates of high housing costs and promising access to internet and computers at home point to strengths of the region in terms of affordability and connectivity for families.

^e Healthy People identifies science-based targets to guide national health promotion and disease prevention efforts. For more information see https://www.cdc.gov/nchs/healthy_people/index.htm

Food security among young children and families

The Special Supplemental Nutrition Assistance Program for Women, Infants and Children, known as WIC, provides food assistance, breastfeeding support, nutrition education and referral to other health and community services for women and children, starting in pregnancy until children turn age 5.^f WIC, along with other programs like free and reduced-price school meals, Temporary Assistance for Needy Families (TANF) and the Supplemental Nutrition Assistance Program (SNAP), can be a key resource for low-income families to ensure they have access to affordable, nutritious food that promotes well-being. Families in Arizona are financially eligible for WIC if their income is at or below 185% of the federal poverty level.^{g, 46} According to 2023 American Community Survey (ACS) estimates, there were **4,816** children birth to age 5 in the La Paz/Mohave Region living in households with qualifying incomes for WIC. This equates to nearly half (**49%**) of the young child population in the region. While the region and Mohave County (**49%**) had a larger proportion of young children whose households financially qualified for WIC compared to the state (**38%**) and U.S. (**35%**), an even larger proportion of young children's households financially qualified in La Paz County (**60%**).

Between 2018 and 2020, the number of young children (birth to age 4) enrolled and participating in WIC in the La Paz/Mohave Region steadily declined, to lows of **4,294** young children enrolled and **3,955** participating in 2020. However, enrollment rebounded in recent years, reaching a high of **4,694** young children enrolled and **4,377** participating in 2024. The region had consistently high participation rates among young children enrolled in WIC in recent years, evident in the small gap between the number of children enrolled versus the number of children participating in the program. These high participation rates have even increased in recent years but fell just below the participation rates among young children across the state, with **93%** of enrolled young children in the region and **95%** enrolled statewide participating in WIC in 2024. Key informants noted that families in the region may be more willing to participate in WIC as compared to other social assistance programs. However, participation barriers remain for some communities in the region, including limitations on where benefits can be used, as some big-box retailers reportedly only accept Tribal WIC.

Families' neighborhood environments also influence their access to affordable, nutritious food. Low-income, low-access areas, also known as "food deserts", are geographic areas with high rates of poverty and limited access to fresh food options, a challenge often compounded by limited

^f For more information see <https://www.fns.usda.gov/wic>

^g In 2026, the 185% FPL threshold was \$61,050 for a family of four and \$40,034 for a family of two. For more information, see <https://aspe.hhs.gov/sites/default/files/documents/b1bfa16b20ae9b89d525bc35de7c1643/detailed-guidelines-2026.pdf>

access to adequate transportation.⁴⁷ Nearly one in every five children birth to age 5 (**54%**) lived in a community in the region^h classified as a low-income, low-access area by the U.S. Department of Agriculture in 2019, much higher than the **15%** classified as such across the state.⁴⁸

Child maltreatment response and prevention

Traumatic or stressful life events experienced in childhood, referred to as Adverse Childhood Experiences or ACEs,ⁱ can have lasting impacts on health and life trajectory beyond childhood, with risk increasing as an individual's number of adverse childhood experiences increases.⁴⁹ In situations of abuse or neglect, the Arizona Department of Child Safety (DCS) is required to intervene to ensure the safety and well-being of children. When DCS determines that the harm in remaining with their family is too great, a child may be removed from their home, either temporarily or permanently. In recent years, DCS has set an overarching goal of safely reducing the number of children removed from their homes and placed in out-of-home care.⁵⁰ In line with this goal, the number of children reported to DCS who were removed from their homes and placed in out-of-home care has substantially declined in recent years in Arizona, from a recent high of **13,465** children age birth to 17 in state fiscal year (SFY) 2021 to **8,305** in SFY 2024. Out-of-home placements in La Paz and Mohave counties also reached a five-year low of **297** children birth to age 17 in SFY 2024. Key informants shared that, due to limited local placement options, some children who enter out-of-home care may be placed outside of the region, far from their homes. They also noted that DCS continues to experience substantial administrative and capacity challenges which may also be influencing the number of placements.

DCS also aims to place children into a permanent, stable housing situation within 12 months, whether that is through reunification, living with other relatives (known as kinship care) or any type of guardianship or adoption.⁵¹ In 2024, almost half (**47%**) of young children birth to age 17 exiting out-of-home care in Arizona were reunified with their families, one in four (**25%**) were adopted^j and one in six (**16%**) were placed in guardianship.^k The other **12%** exited out-of-home

^h To view a map of low income and low access census tracts, see <https://www.ers.usda.gov/data-products/food-access-research-atlas/go-to-the-atlas>

ⁱ Adverse Childhood Experiences (ACEs) include eight categories of traumatic or stressful life events experienced before the age of 18 years. The eight ACE categories are sexual abuse, physical abuse, emotional abuse, household adult mental illness, household substance abuse, domestic violence in the household, incarceration of a household member, and parental divorce or separation.

^j Adoption by a relative, foster parent or other non-relative

^k Guardianship by a foster parent or other non-relative

care for some other reason, including children who aged out of the out-of-home care system, transferred to another agency, ran away or exited for another reason.

Home visitation programs are a proven strategy for equipping families with needed resources and referrals to promote healthy child development, reduce parental stress and prevent future child maltreatment.^{52, 53, 54, 55} In state fiscal year 2025, **668** families in the La Paz/Mohave Region participated in home visitation programs, including the Healthy Families Arizona, Health Start, High-Risk Perinatal Program and First Things First-funded Parents as Teachers programs.

EARLY LEARNING

Availability of quality early care and education

Participating in quality preschool programs can provide children with the equivalent of one-third to a full year of additional early learning in language, reading and math skills, increasing the academic readiness of children when they enter kindergarten.⁵⁶ According to 2023 American Community Survey (ACS) estimates, **32%** of 3- and 4-year-olds were enrolled in school¹ in the La Paz/Mohave Region, lower than the proportion across the state (**36%**).⁵⁷ In the 2024-25 school year, **66** children were enrolled in preschool in public schools in La Paz County, and **535** were enrolled in Mohave County. Both counties saw overall increases in enrollment in recent years, with notably declines in both 2021 and 2023. However, there is likely even more capacity in school-based preschool programs in the county than reflected in these numbers. Not all preschool students are well-captured in ADE enrollment data, particularly typically-developing students in part-day programs and preschool students whose families pay a fee for care at a school.

In 2025, there were **99** early care and education providers in the region with the capacity to serve **6,239** children. Most of this was provided by **73** child care centers with the capacity to serve **5,058** children, followed by **17** schools (n = **1,109**), and **9** home-based providers (n = **72**). Between 2023 and 2025, **8** new licensed child care providers opened in the La Paz/Mohave Region, and **no** licensed child care providers closed.

An area is labeled a child care desert if there are three times as many children as there are available child care slots (a ratio of **3.0** or more).⁵⁸ Communities in both urban and rural areas of Arizona face a gap between the number of young children and licensed child care slots.^{59, 60, 61} Collectively across all children birth to age 5, the La Paz/Mohave Region was not considered a child care desert, with a ratio of **2.5** children birth to age 5 per available slot, just above the ratio for children birth to age 5 statewide (**2** children birth to age 5 per available slot).⁶² For 1-year-olds, the ratio was higher and qualified as a child care desert, with **5.2** 1-year-olds per available slot. The ratio for regulated infant care was highest, with **12.4** infants per available slot, indicating a scarcity of licensed infant child care in the region. Local key informants noted that the largest local child care center, New Day, only accepts children over 18 months old, and that finding available spaces for infants and toddlers is indeed a challenge in many communities in the region. Sites that do offer infant care carry long waitlists. Many families likely turn to unregulated home-based providers to fill that gap. Key informants also noted that they see parents leaving the workforce when they can't find infant care.

¹ School includes nursery school, preschool or kindergarten.

Figure 7.

Availability of quality early care and education

² Arizona Department of Education. (2025). [October 1 Enrollment, Graduation Rates, Dropout Rates, State Assessment dataset].

³ Arizona Department of Economic Security. (2025). [National Child Care Data System NCCRAware database extract].

⁴ Arizona Department of Health Services. (2025). [Child Care Licensing dataset].

Note: Please note that the capacity estimates are based on licensed capacity of the facility (frequently determined by physical building capacity) and may overstate the number of children that are actually enrolled in early education (due to staffing limitations and provider preferences). In the 2022-23 and 2023-24 school years, La Paz County preschool enrollment was suppressed by ADE despite there being more than 10 children enrolled countywide.

Increasing access to quality early care and education

High-quality early learning experiences lay a strong foundation for children's success in kindergarten, elementary school and beyond.⁶³ One way that the quality of early child care and education is measured in Arizona is through the Quality First (QF) program.⁶⁴ The QF program rates the quality of child care providers and preschools on a scale from one to five stars, with providers considered high quality when they have received a 3-star rating or higher.⁶⁵ In the La Paz/Mohave Region, the **39** providers served by QF enrolled a total of **1,715** young children in 2025, and **29** of the 31 publicly-rated child care providers had 3-5-star ratings.^m Three and four-year-olds were most often enrolled in quality settings (**429** and **608** respectively), followed by 5-year-olds (n = **261**), 2-year-olds (n = **196**), 1-year-olds (n = **145**) and infants (n = **76**).

Child care providers enrolled in QF offer scholarships to eligible families to allow those children to access care and to reimburse providers for some of their extra expenses for providing quality care. These scholarships are allocated based on the child care provider's capacity and QF star rating.⁶⁶ However, due to the end of federal pandemic relief funds, statewide allocations for scholarships have decreased by over 3,000 slots from 2024 to 2025.⁶⁷ The number of QF scholarships provided in the region followed the same downward trend from 2024 (n = **239**) to 2025 (n = **130**).

^m Eight of the 39 child care providers in the La Paz/Mohave Region served by Quality First are not publicly rated.

Figure 8.

Increasing access to quality early care and education

¹ First Things First. (2025). [Quality First dataset].

Cost of early care and education

The high cost of formal early care and education can place it out of reach of many families. The average cost of care in Arizona varies by the type of provider and the age of the child, with licensed centers and care for infants the most expensive, largely due to the higher operational costs of center-based care.⁶⁸ The median cost of care for an infant in a licensed center in Arizona in 2024 was **\$1,289** per month in 2024.⁶⁹ In Western Arizona (La Paz, Mohave and Yuma counties), this type of care was also the most expensive at **\$892** per month, although only slightly more expensive than group home care for infants (**\$840/month**). The least expensive type of care in Western Arizona for infants and 3–5-year-old children was in certified family homes, where median charges are **\$556/month** for infants and **\$563/month** for 3-5-year-olds. The least expensive type of care for 1-2-year-old children was in public schools, with median charges of **\$598/month**. However, as mentioned previously, there are only **9** registered home-based providers and **17** public schools in the region, making up only **23%** of the region’s early care capacity, meaning that these settings for care, while more affordable, may not be a realistic option for many families.

According to the U. S. Department of Health and Human Services, to be considered affordable, a family should spend no more than 7% of their income on child care.⁷⁰ In Arizona, both married and single-parent families are estimated to spend well above the “affordable” share of their income on infant care.^{71, 72} In Western Arizona, center-based care for one infant costs between **17%** and **19%** of median income for families with children. La Paz County families pay a larger proportion of their income for center-based care (**16 - 19%**), compared to families in Mohave County (**14 - 17%**) and across the state (**13 - 17%**). The cost of care in Western Arizona increased in recent years, with the cost of care for infants and 3-5-year-olds increasing the most (both **+13%**) between 2022 and 2024. The cost of care for 1-2-year-olds increased **10%** during the same period. Notably, key informants shared that one local school district opened a fee-based preschool classroom alongside their pre-K classrooms (i.e., a Title 1 section and classes for students with special needs), but they couldn’t fill that preschool classroom due to families being unable to afford the cost of care.

Figure 9.

Cost of early care and education

Note: Western Arizona includes Mohave, La Paz & Yuma counties.

Early care and education assistance and quality

The Arizona Department of Economic Security (DES) provides child care assistance to financially eligible families, including specific funding for families involved with the Arizona Department of Child Safety (DCS).⁷³ This assistance can make child care more accessible for families. Eligibility for and receipt of DES child care assistance among non-DCS-involved families recently reached record highs due to recent statewide investments.^{74, 75} The La Paz/Mohave Region showed more variability compared to statewide trends, with a high of **713** non-DCS-involved children birth to age 5 found eligible for DES child care assistance in 2020 and a high of **622** children birth to age 5 receiving DES child care assistance in 2024. In 2024, **91%** of non-DCS-involved eligible families used child care assistance. However, the proportion of these young children receiving child care assistance in quality environments in the region (**50%**) was much lower than non-DCS-involved children across the state (**80%**). Unfortunately, due to insufficient funding the DES child care assistance waitlist was reinstituted statewide in August 2024.ⁿ

Children are automatically eligible for DES child care assistance when they are involved with DCS.^o For DCS-involved children, the number of children birth to age 5 eligible for child care assistance in the La Paz/Mohave Region decreased from a recent high of **406** in 2019 to a low of **230** in 2024. The number of DCS-involved young children receiving child care assistance followed a similar pattern with **177** DCS-involved children birth to age 5 receiving assistance in 2024. Those children in the region were less likely to receive this child care assistance in quality environments (**67%**) compared to DCS-involved children across the state (**84%**), but more likely than non-DCS-involved children in the region (**50%**). Local key informants discussed the challenges of getting into a high-quality facility with child care assistance, given that families paying out of pocket tend to fill available slots. Thus, once a family is deemed eligible, there may be no spots in quality providers available.

To expand access to quality child care, DES provides enhanced reimbursement rates to child care providers that are considered high quality, including having a 3- to 5-star Quality First rating, national accreditation or applying Head Start Performance Standards. As of November 2025, quality child care providers across Arizona were reimbursed an additional **40%** above the standard reimbursement.

ⁿ As of May 1, 2026, there were more than 12,000 children waitlisted statewide. For more information, see <https://des.az.gov/services/child-and-family/child-care/how-apply-for-child-care-assistance>

^o Children involved with DCS include children who have been removed by DCS and placed with a foster family or kinship caregiver as well as children who are residing with their own family but receiving services from DCS (such as in-home family support and counseling). Families of these children are not required to pay a co-pay for child care.

EDUCATION & WORKFORCE

K-12 education attendance and achievement

In addition to a quality early childhood education system, a community's K-12 education system can support positive outcomes for children, families and the overall well-being of the community. Individuals who have higher levels of education tend to live longer and healthier lives, and graduating from high school, in particular, is associated with better health, financial stability and socio-emotional outcomes.^{76, 77} Across both La Paz and Mohave counties, kindergarten through 3rd grade enrollment decreased overall between the 2018-19 and 2024-25 school years. In La Paz County, the lowest recent enrollment counts were in the 2023-24 school year (**646** students), compared with a high of **762** students enrolled in the 2019-20 school year. Mohave County enrolled a high of **7,243** students in the 2018-19 school year, declining to a low of **6,561** students in the 2020-21 school year, and ending at **6,857** students enrolled in the 2024-25 school year. Local key informants attributed recent declines in La Paz County, specifically, to families moving out of the area, potentially to Bullhead City, and an increasing interest in homeschooling.

Some Arizona families use Arizona's Empowerment Scholarship Account (ESA) to pay for eligible educational expenses, including private or online school tuition, individual public school classes and extracurriculars.⁷⁸ This program was established in 2011 for students with disabilities and expanded to universal eligibility in 2022.^{79, 80} These funds can also be spent on other approved education costs, such as tutoring, technology, textbooks, supplies and national standardized test fees.^{81, 82} In the 2024-25 school year, **3,168** students (preschool through grade 12) in La Paz and Mohave counties used ESAs, accounting for about **3%** of Arizona's **94,600** ESA participants.⁸³ By comparison, there were **25,376** total students (preschool through grade 12) enrolled in public and charter schools in La Paz and Mohave counties in the 2024-25 school year.

Children's 3rd grade reading comprehension and proficiency skills can predict their future academic success, such as their likelihood of graduating high school and attending college.⁸⁴ Although they remain distressingly low, 3rd grade math assessment passing rates increased in recent years in La Paz and Mohave counties and across the state. La Paz County rates increased from **30%** in the 2021-22 school year to **31%** in the 2023-24 school year, while Mohave County math passing rates rose from **37%** to **44%**. In Mohave County, 3rd grade reading passing rates also improved from the 2021-22 to 2023-24 school year, from **36%** to **37%**.^p In contrast, statewide, reading passing rates declined from **41%** to **39%**. In the 2023-24 school year, **23%** of 3rd grade students in La Paz County passed the reading assessment.

^p La Paz County 3rd grade reading assessment passing rates were suppressed for the 2021-22 school year.

School attendance is an important factor in predicting the academic performance and future health of children. Chronic absenteeism, defined as missing 10% of school days in a school year, predicts a student experiencing academic difficulties and even dropping out of school entirely.⁸⁵ Following the COVID-19 pandemic, chronic absenteeism has become a major issue in school districts nationwide.⁸⁶ More than four in 10 kindergarten students (**41%**) and over one-third of 3rd grade students in La Paz County (**35%**) were chronically absent from school in the 2022-23 school year, compared to less than three in 10 kindergarten students (**29%**) and fewer than two in 10 3rd grade students (**18%**) pre-pandemic in the 2018-19 school year. Mohave County showed a similar trend from before the pandemic to the most recent data, but chronic absenteeism remained lower than in La Paz County. In the latest available data, **22%** of kindergarteners and about one-fourth (**23%**) of 3rd graders in Mohave County were chronically absent in the 2022-23 school year. Statewide, the kindergarten chronic absence rate was **25.5%** and the 3rd grade chronic absence rate was **23.8%** in the 2022-23 school year.⁸⁷ Increasing attendance among kindergarten students presents a particular challenge because the state mandated age of school enrollment is 6 years, so absences in kindergarten are often not considered truancy, meaning schools have fewer resources to address them.

Graduation and adult educational attainment

Understanding current high school graduation and dropout rates within the state provides insight into the assets and challenges faced by a community and its future workforce. In contrast to adults who dropped out of high school and even those that received a high school equivalency diploma (HSE, also commonly referred to as a GED), adults who graduated from high school have higher rates of employment, higher incomes and better overall health.⁸⁸ Four-year graduation rates in La Paz and Mohave counties have varied from the state's rates in recent years.⁸⁹ In the 2023-24 school year, the four-year graduation rate was **85%** in La Paz County and **77%** in Mohave County, compared to the statewide rate of **78%**.⁹⁰ In that same year, the five-year graduation rate was **88%** in La Paz County and **79%** in Mohave County, compared to **81%** statewide.⁹¹

Compared to the U.S. as a whole, Arizona has a larger proportion of disconnected youth, defined as teenagers ages 16 to 19 who are neither attending school nor employed,⁹² which has been linked to negative physical and mental health outcomes and higher rates of unemployment.⁹² Dropout rates for 7th to 12th grade students in La Paz and Mohave counties have increased overall since the COVID-19 pandemic, with both counties reaching **6%** dropout rates in the 2023-

⁹² Age ranges for "disconnected youth" vary by source, with some estimates including both teenagers ages 16-19 and young adults ages 20-24 and others focusing on only teenagers or young adults.

Figure 11.

K-12 education attendance and achievement

¹ Arizona Department of Education. (2025). [October 1 Enrollment, Graduation Rates, Dropout Rates, State Assessment dataset].

² Arizona Department of Education. (2025). [Empowerment Scholarship Account Enrollment].

³ Maricopa Association of Governments. (2026). [ReadOn Arizona MapLIT dashboard reports: enrollment, chronic absences, assessments].

Notes: Chronic absences are defined as children missing 10% or more school days. Schools reported absences data very differently in school year 2019-20 due to the onset of the COVID-19 pandemic and the shift to remote learning. Absences data were not available for kindergarteners in school year 2023-24. La Paz County enrollment data were suppressed in the 2022-23 and 2023-24 school year by ADE despite having more than 10 students countywide.

24 school year, higher than the **4%** rate of both counties in the 2018-19 school year. Statewide, the 7th to 12th grade dropout rate was **5.3%** in the 2023-24 school year.⁹³

Education is a key mechanism for upward economic mobility. As educational attainment in a population increases, wages increase and rates of unemployment decrease.⁹⁴ Of U.S. adults working full time in 2021, median earnings for those with a bachelor's degree were \$29,000 higher than those with a high school degree.⁹⁵ According to 2023 American Community Survey (ACS) estimates, almost nine in 10 (**89%**) adults ages 25 and older in the La Paz/Mohave Region had at least a high school education, the same proportion as across the state (**89%**).⁹⁶ In the region, **15%** had a bachelor's degree or more. Nearly three in 10 (**29%**) had some college but no degree; this includes individuals who received a Child Development Associate (CDA) credential or other similar post-secondary credential.^r

Adult employment

Unemployment and underemployment^s can impact families in ways that affect children's health and well-being.⁹⁷ Unemployment can limit access to resources that support children's physical and mental health, like health insurance, and can also contribute to family stress, conflict, homelessness and child abuse.^{98, 99} Children with parents who have lost their jobs may also experience poorer school performance and behavioral issues, resulting in grade repetition, suspension or expulsion.¹⁰⁰ Unemployment rates in La Paz County and Mohave County have followed the same trend over time as the state, but have consistently been just above state rates. La Paz County had unemployment rates two percent higher than the state overall, while Mohave County did slightly better, with unemployment rates consistently closer to those of the state. After the spike in rates during the beginning of the COVID-19 pandemic in 2020, unemployment rates improved and were mostly constant since 2022. In 2024, the unemployment rate was **6%** in La Paz County, **4%** in Mohave County and **4%** across Arizona.

The labor force participation rate includes all persons who are working (employed) or looking for work (unemployed). Persons not in the labor force are largely students, stay-at-home parents, retirees and institutionalized people. According to 2023 American Community Survey (ACS) estimates, under half (**43%**) of the population ages 16 and older was participating in the labor

^r Please note that adults with post-secondary certificates and credentials, such as Certified Nursing Assistant (CNA), Certificates of Proficiency in early childhood, and other certificate programs that can be completed in less than two years, are counted in the "some college, no degree" category by the American Community Survey. This means that many of the **29%** of adults with some college, no degree in the region may hold post-secondary credentials.

^s Underemployment means that someone works fewer hours than they would like or is in a job that does not require the skills or training that they have.

Figure 12.

Graduation and adult educational attainment

Trends in 4-year and 5-year graduation rates¹

La Paz County

Mohave County

Trends in 7th to 12th grade dropout rates¹

Level of education of adults in the La Paz/Mohave Region (2023)²

¹ Arizona Department of Education. (2025). [October 1 Enrollment, Graduation Rates, Dropout Rates, State Assessment dataset].

² U.S. Census Bureau. (2024). 2023 American Community Survey Five-Year Estimates, 2019-2023.

Notes: Graduation rates are calculated as the percentage of students in a cohort (typically those who enter ninth grade together) who graduate within 4 or 5 years. While 5-year graduation rates are usually higher than 4-year graduation rates, due to the COVID-19 pandemic, students moved in and out of high school differently in 2020 and 2021 than in prior years, leading to larger than normal 5-year high school cohorts. Dropouts are defined as students who are enrolled in school at any time during the school year, but are not enrolled at the end of the school year and did not transfer, graduate or die. [State of Arizona Department of Education Graduation, Dropout & Persistence Rate Technical Manual].

force in the La Paz/Mohave Region, meaning a small majority (57%) of the population in the region was not working or actively looking for work. This labor force participation rate was notably lower than that for the state (61%) and U.S. (64%). The region's (7%) and Mohave County's (7%) unemployment rate was lower than the unemployment rate in La Paz County (11%), but higher than across the state and U.S. (both 5%). Some key employment sectors in La Paz and Mohave counties include retail trade, health care and social assistance, accommodation and food services, public administration and construction.

Quality early care and education programs rely on a strong workforce, but factors like low pay make it difficult to recruit and retain these educators. Early care and education is also a field with notable pay disparities;^t with those working as a home care provider, in a Head Start program or a public pre-K program getting paid varying amounts despite performing similar work. For example, the average kindergarten teacher's salary in Arizona is about twice that of an early educator for children birth to age 5.¹⁰¹ In Arizona, there were 13,260 early education professionals active in the Arizona Early Childhood Workforce Registry^u in November 2025. The median wage for registered early education professionals in the state was \$17/hour, ranging from \$21.91/hour for directors to \$16/hour for assistant teachers. All median wages fell below the 2025 self-sufficiency standards for one adult and one infant in La Paz (\$24.05/hour) and Mohave (\$25.37/hour) counties.¹⁰²

^t Programs such as Head Start and public pre-K programs receive federal funding supports that often allow for better wages and compensation in these settings compared to child care settings that don't receive these funds.

^u The Arizona Early Childhood Workforce Registry is Arizona's online hub for early childhood educators to track their employment, formal education, and professional development opportunities throughout their career. Early childhood educators access the registry to explore a directory of training, conferences, and other learning opportunities to support career development; fulfill state regulatory training requirements; apply for scholarships to pursue credentials, certificates, and degrees in early childhood education; and to establish career and professional development goals.

Figure 13.

Adult employment

¹ Arizona Office of Economic Opportunity. (2025). [Local Area Unemployment Statistics & Industry Employment datasets].

² U.S. Census Bureau. (2024). 2023 American Community Survey Five-Year Estimates, 2019-2023.

³ First Things First. (2025). [Arizona Early Childhood Workforce Registry dataset].

Notes: The "labor force" is all persons who are working (employed) or looking for work (unemployed). The "labor force participation rate" is the fraction of the population who are in the labor force, whether employed or unemployed. Persons not in the labor force are mostly students, stay-at-home parents, retirees, and institutionalized people. The "unemployment rate" is the fraction of the civilian labor force who are unemployed. Educator wage data from the Early Childhood Workforce Registry reflect wages from a sample of early educators active in the registry including teachers (n=6,054), assistant teachers (n=5,535), and directors (n=1,671).

CHILD DEVELOPMENT & HEALTH

Maternal and infant health

Access to quality health care can promote positive health outcomes for mothers and infants.¹⁰³ Prenatal care is associated with reduced complications during pregnancy and birth, while also providing expectant parents with an opportunity to engage with health professionals.^{104, 105} The rate of timely prenatal care (care initiated in the first trimester) in the La Paz/Mohave Region rose steadily from 2019 (**67.2%**) to 2023 (**74.1%**), and ended that year above the state rate (**71.4%**). The proportion of births to mothers receiving no prenatal care in the region decreased slightly overall from **2.4%** in 2019 to **2.2%** in 2023. Births to mothers in the region with some prenatal care (i.e., one to four prenatal visits) also declined overall over those years, from **5.1%** to **4.2%**. Key informants noted that limited availability of specialists in the region and challenges with insurance create barriers to timely prenatal care for families in the region. As a result, some families may delay care until insurance coverage is available, and many must travel long distances to communities where obstetric and pediatric care are available, though access to these services may also be limited in those areas.

Outside of access to adequate prenatal care, other risk factors like low birth weight, preterm birth and the mother's age at birth can impact child health outcomes.^{106, 107} Low birth weight births (weighing less than 5 pounds and 8 ounces or 2,500 grams) and preterm births (those delivered before 37 weeks of pregnancy) can result in cognitive, respiratory, diabetes and gastrointestinal issues and are one of the largest drivers of infant mortality in the U.S.¹⁰⁸ The La Paz/Mohave Region had a varying proportion of low-birth-weight births between 2019 and 2023, from a low of **6.6%** in 2019 to a high of **8.1%** in 2022, before declining to **7.1%** the following year. Preterm births in the region also varied between 2019 and 2023, ranging from lows of **8.6%** in 2020 and 2021 to a high of **10.1%** in 2022, before again declining into 2023 (**9.5%**). In 2019, 2020 and 2021, the La Paz/Mohave Region met the Healthy People 2030 target for preterm births (no more than **9.4%**). Conversely, Arizona failed to meet the target since 2020, with **9.9%** of births in the state being preterm in 2023.

Teenage parents often experience increased stress and hardship in comparison to adult parents and other non-parent teenagers. They are less likely to complete high school or college and more likely to maintain a lower socioeconomic status and require public assistance to make ends meet.^{109, 110, 111, 112, 113} Births to teenaged mothers (ages 19 and younger) in the La Paz/Mohave Region declined overall between 2019 and 2023, from **6.8%** in 2019 to **6.1%** in 2023, although the region consistently had a slightly higher rate of births to teenage mothers than statewide trends, which declined from **5.5%** to **4.5%** over the same period. Key informants noted targeted efforts in

the region to expand teen parents' access to home visitation programs through collaborations with high schools, hospitals and the Department of Child Safety.

Access to care and service navigation

Health insurance coverage is an important indicator of whether families can access, afford and utilize medical care, including access to well-child visits and developmental screenings at a lower cost. According to 2023 American Community Survey (ACS) estimates, **94%** of young children birth to age 5 in the La Paz/Mohave Region had health insurance, a slightly higher proportion than the **93%** of young children insured statewide.¹¹⁴ Between 2019 and 2022, the number of young children birth to age 5 in the region enrolled in the Arizona Health Care Cost Containment System (AHCCCS; Arizona's Medicaid program) steadily increased, reaching a high of **8,027** young children in 2022. Enrollment declined each year after 2022, following statewide trends and likely influenced by the post-pandemic requirement that all members enrolled in AHCCCS reverify their enrollment starting in April 2023.¹¹⁵ Key informants highlighted that AHCCCS also helped some families in the region access care in larger cities, such as Phoenix, by providing transportation support. However, mixed-status families and other households in the region may still face challenges navigating eligibility, coverage and service access.

Well-child visits provide scheduled opportunities for pediatricians to monitor growth and development, administer immunizations, observe familial dynamics and provide guidance to caregivers on essential topics and emerging milestones.^{116, 117, 118} Between 2019 and 2024, between **63%** and **70%** of children birth to age 5 enrolled in AHCCCS in the La Paz/Mohave Region had one or more well-child visits, just below the proportion across the state during those years (**66%** - **72%**).

The American Academy of Pediatrics recommends that providers ask parents about developmental concerns at all infant and well-child visits and have parents complete a standardized developmental screening at the 9-, 18- and 30-month appointments.¹¹⁹ Ensuring that children have access to timely and adequate screening and intervention services from birth to age 5 can be key for preparing children for kindergarten. In 2024, **1,535** developmental screenings for children birth to 5 in the La Paz/Mohave Region were covered by AHCCCS. In state fiscal year (SFY) 2025, **102** children birth to age 5 in the region received a developmental screening funded by the First Things First Home Visitation strategy. Based on the 2020 Census, this would represent just over **15%** of children birth to age 5 in the region. Key informants identified home visitation programs as an asset in expanding access to developmental screenings in the region.

Oral health is a fundamental component of overall health, well-being and self-confidence. Children with dental pain and lower oral health-related quality of life have more school absences and worse academic performance.^{120, 121, 122} In the La Paz/Mohave Region, just over half (**54%**) of

kindergarteners in public schools experienced some type of tooth decay and **21%** had untreated decay during the 2018-19 through 2023-24 school years, similar to the state's rates for decay experience (**50%**) and untreated decay (**24%**). Like the prevalence of decay, the La Paz/Mohave Region had a similar proportion of children who had a dental visit in the last year (**75%**) compared to the state (**76%**) and who had dental insurance (**86%** and **84%**, respectively), demonstrating that most children in the region had access to dental care and thus an increased opportunity for preventative care and treatment.

Immunization and child mortality

Immunization serves as the best method to prevent communicable childhood diseases in children and their communities. When enough children are immunized, the protection even extends to those who are unable or who choose not to be vaccinated.¹²³ In Arizona, one of the required immunizations to enroll in preschool and kindergarten is measles, mumps and rubella (MMR).¹²⁴ Both the La Paz/Mohave Region and Arizona had declining MMR immunization rates in kindergarteners between the 2022-23 and 2024-25 school years, although the region's decline was more pronounced and ended 10% lower than the state rate. Arizona's coverage declined slightly from **89.9%** (2022-23) to **88.7%** (2024-25), while the region's coverage fell from **82.8%** (2022-23) to **78.4%** (2024-25). This means that about two in 10 kindergarteners in the region were not fully immunized against MMR in recent years. It also means MMR coverage in the region and state was well below the threshold for herd immunity of **95%**, and neither the region nor the state met the Healthy People 2030 target of **95%** or higher.¹²⁵ This is especially concerning as Arizona has been experiencing an active measles outbreak, and Mohave County had **285** reported cases of measles as of June 4, 2026 (La Paz County had **0**).^v

Children may be exempted from vaccination based on medical restrictions, religious beliefs or personal beliefs. Medical exemptions can apply to students of all ages, while religious belief exemptions apply to students in early care and education programs and personal belief exemptions apply to K-12 students.¹²⁶ Exemptions among children in child care and kindergarteners in the La Paz/Mohave Region were consistently higher than exemptions across the state. Among children in child care, **12.1%** received a religious exemption in the 2024-25 school year, and **15.9%** of kindergarteners in the region received a personal belief exemption that same year. For both children in child care and kindergarteners in the region, exemptions increased overall from the 2020-21 to 2024-25 school years, with **9.2%** of children in child care and **12.9%** of children in kindergarten exempt from all immunizations in the 2024-25 school year. These exemption rates were also higher than for children in child care (**4.8%**) and kindergarteners

^v For more up-to-date case counts see <https://www.azdhs.gov/preparedness/epidemiology-disease-control/measles/index.php>

Access to care and service navigation

¹ U.S. Census Bureau. (2024). 2023 American Community Survey Five-Year Estimates, 2019-2023.

² ASU CHiR. (2025). [AHCCCS claims dataset].

³ First Things First. (2025). [Home Visitation & Screenings Reach datasets].

⁴ First Things First. (2025). [Healthy Smile Healthy Bodies survey dataset].

Note: AHCCCS data reflect children birth to age 5 with approved insurance claims– these data may not reflect all care provided in the region. Developmental screenings were provided through the FTF-funded Home Visitation strategies. Overall, 124 children received developmental, socio-emotional, hearing and vision screenings in the region

(4.7%) statewide that year.¹²⁷ Key informants cited misinformation and disinformation spread through social media and other online content as contributing factors to increasing vaccine exemptions in the region. They suggested that home visitation programs could provide an important opportunity for more direct vaccine education and support.

Healthy People 2030 set a target of no more than **5.0** infant deaths per 1,000 live births, which neither the La Paz/Mohave Region, La Paz County, Mohave County nor the state met. Between 2021 and 2023, the infant mortality rate for the region was **6.1** deaths per 1,000 live births. La Paz County's rate was much higher (**12.4**) while Mohave County (**5.4**) and the state (**5.7**) had lower infant mortality rates. Between 2021 and 2023, young child mortality was almost three times as high in La Paz County (**119** deaths per 100,000 children ages 1-4) compared to Mohave County (**40.1**), which itself was notably higher than the state young child mortality rate (**29.8**). It is important to note that La Paz County had a relatively small population of young children (**949** children birth to age 5 according to the 2020 Census), so this larger mortality rate, in reality, equates to a very small number of child deaths. However, these data do suggest that young children in La Paz and Mohave counties face higher risks of death than children statewide. Statewide, the leading causes of death for infants were prematurity and suffocation, while drowning was the leading cause of death for children aged 1 to 4 years.¹²⁸

Young children with special needs

Timely connection with early intervention services—such as speech, physical, occupational and behavioral therapy— can critically shape school readiness and the developmental trajectory of young children with medical conditions, developmental delays and even certain risk factors for delays.¹²⁹ In Arizona, the Department of Economic Security's (DES) Arizona Early Intervention Program (AzEIP), the Division of Developmental Disabilities (DDD), and the Arizona Department of Education's (ADE) Early Childhood Special Education Program each play a role in providing services to families with children who have special needs.

AzEIP^w provides early intervention and a variety of supportive services to families of children birth to age 2 with developmental delays or disabilities.¹³⁰ In state fiscal year (SFY) 2024, children birth to age 2 in the La Paz/Mohave Region were most frequently referred to AzEIP by physicians (**69%**). Parents and families were the second most common referral source (**16%**), followed by a health or service agency (**7%**) or the Department of Child Safety (DCS, **5%**). Fewer than four in 10 young children (**38%**) referred to AzEIP in the La Paz/Mohave Region were found eligible for services, including **36%** who received services, **1%** found eligible without beginning services within the fiscal

^w For more information on AzEIP (which is a division of the Department of Economic Security), visit <https://www.azdes.gov/azeip/>

Note: PBE in the kindergarten exemption figure stands for personal belief exemption.

year, and another **1%** found eligible but whose families declined services. **Twenty-four percent** of referred children were assessed as not eligible for services (**19%**) or were screened out (**5%**). In an additional **37%** of referrals, families were either not interested in services (**21%**) or not able to be reached (**16%**).

Between SFY 2018 and SFY 2024, the number of children birth to age 2 who received services from AzEIP in the region steadily increased, reaching a seven-year high of **192** children birth to age 2 in SFY 2024. The **192** children served by AzEIP in SFY 2024 represent **3.9%** of children birth to age 2 residing in the region per the 2020 Census. This is slightly higher than the **2.5%** of children birth to age 2 receiving AzEIP services statewide but lower than the proportion of young children accessing early intervention nationally (**4.3%**).¹³¹ National research suggests that many more young children would likely benefit from early intervention than are receiving it.¹³² Key informants noted several barriers that can make it difficult for families to participate in AzEIP. For example, families may be unable to follow-up with AzEIP if caregivers have limited job flexibility or face transportation barriers. Informants also noted that the region has a limited number of AzEIP providers, which can make it difficult to reach all families who receive a referral. Key informants also noted that the region used to have home visiting (Parents as Teachers) programming which also supported families in understanding child development and developmental milestones, but that program is no longer available.

Children who receive a diagnosis of autism, cerebral palsy, epilepsy, cognitive or intellectual disability or down syndrome may also become eligible for services through DDD.^x The number of children birth to age 5 in the La Paz/Mohave Region receiving DDD services decreased sharply from a high of **128** young children in SFY 2018 to a low of **51** young children in SFY 2021; service numbers increased yearly after that, to **101** young children served by DDD in SFY 2024. Qualifying children may receive services from AzEIP and/or DDD, a number which can be used to estimate the total number of young children receiving early intervention services in a region. A total of **285** children birth to age 5 in the region received services from AzEIP and/or DDD in SFY 2024. This equates to **2.7%** of all children birth to 5 in the La Paz/Mohave Region based on estimates from the 2020 Census. Key informants stated that some families have expressed hesitation about applying for DDD services because of lawful presence requirements for the applicant.

^x For more information on DDD (which is a division of the Department of Economic Security), visit <https://des.az.gov/services/disabilities/developmental-disabilities>

Figure 17.

Young children with special needs

Note: Data on young children receiving services reflect the Oct 1 snapshot of AzEIP services, not a cumulative total throughout the year.

Preschool to 3rd grade students with special needs

As a child with special needs approaches age 3, they can be transferred from AzEIP to the Early Childhood Special Education Program to receive services through their local education agency (LEA).^y In the La Paz/Mohave Region, the number of children aged 3 to 5 receiving special education services through their LEA decreased from a recent high of **273** in state fiscal year (SFY) 2018 to a low of **248** the following year, later increasing to **259** in SFY 2022. Across Arizona, the number decreased from a recent high of **10,521** in SFY 2020 to **8,086** in SFY 2022, representing a **23%** decrease over those two years. Key informants noted several regional challenges to working with LEAs, including limited family buy-in, provider shortages and limited service hours.

Like the overall increase in the number of K-3rd grade students enrolled in special education across the state from SFY 2018 (**36,468**) to SFY 2022 (**37,334**), the region experienced an overall increase during the same period, from **968** children in SFY 2018 to **1,066** in SFY 2022. Notably, these numbers are higher than the early intervention participation would suggest, which may reflect the number of children not getting an adequate assessment of their needs and abilities until they enter the public school system.

Of children ages 3 to 5 receiving special needs services, the vast majority were diagnosed with a developmental delay (DD, **41%**), or preschool severe delay^z (PSD, **40%**). **Eighteen percent** had a diagnosis of speech language impairment and **2%** had another diagnosis.^{aa} Speech language impairment was the most common disability among kindergarten through 3rd grade students in special education (**36%**), followed by specific learning disability (SLD, **20%**), developmental delay (**18%**), another diagnosis (**14%**) or autism (**13%**). Local key informants said that the need for pre-K placements has increased dramatically since COVID, with a notably high incidence of speech-related issues. Local school districts are serving children with pronounced delays, including nonverbal children. Bullhead City in particular runs a developmental preschool serving at least 93 3–5-year-old children with special needs, and the demand is so high that bus service isn't available for children needing only speech services. Key informants also noted that child care providers in the region have traditionally supported hearing screening for young children, but that access to the necessary resources to offer these services has become more limited in recent years.

^y For more information on ADE's Early Childhood Special Education program, visit <https://www.azed.gov/specialeducation/early-childhood-special-education> and <https://www.azed.gov/specialeducation/early-childhood-special-education-child-find>

^z In Arizona, preschool severe delay is defined as performance on a norm-referenced assessment that is more than three standard deviations below the mean for typically developing children in the areas of cognitive, physical, communication, social-emotional or adaptive development.

¹ Arizona Department of Education. (2023). [Exceptional Student Services dataset].

Note: Most common disabilities in the "Other" category are other health impairments (these are usually chronic health conditions that affect a child's ability to attend or participate in school), intellectual disabilities, emotional disturbance, hearing or vision impairment, multiple disabilities, orthopedic impairments, and deaf-blindness.

MAPS & METHODS

Methods

U.S. Census and American Community Survey Data. The U.S. Census^{bb} is an enumeration of the population of the United States conducted every ten years, and includes information about housing, race, and ethnicity. The 2020 U.S. Census data are available by census block. There are about 108,000 inhabited blocks in Arizona, each with an average population of 66 people. The 2020 U.S. Census data for the region presented in this report were calculated by identifying each block in the region and aggregating the data across all of those blocks. With the implementation of new privacy measures by the U.S. Census, some data previously available at the block level, such as grandchildren living in a grandparent's households or counts of households with children birth to age 5, are now only published at the block group or tract level. Regional estimates for these indicators were calculated by aggregating data over the census tracts which are wholly or partially contained within the region. Data from partial census tracts were apportioned according to the percentage of the 2020 U.S. Census population in that tract living inside the region.

The American Community Survey (ACS)^{cc} is a survey conducted by the U.S. Census Bureau each month by mail, telephone and face-to-face interviews. It covers many different topics, including income, language, education, employment and housing. ACS data are available by census tract. Arizona is divided into approximately 1,750 census tracts, each with an average population of 3,900 people. ACS data for the region were calculated by aggregating over the census tracts which are wholly or partially contained in the region. The data from partial census tracts were apportioned according to the percentage of the 2020 U.S. Census population in that tract living inside the region. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2019 to 2023. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates.

Child care capacity calculations. Lists of child care providers are maintained by multiple state agencies in Arizona, including the Arizona Department of Health Services (ADHS), which licenses child care centers; the Arizona Department of Economic Security (DES), which maintains the list of

^{aa} The most common disabilities in the "Other" category are other health impairments (these are usually chronic health conditions that affect a child's ability to attend or participate in school), intellectual disabilities, emotional disturbance, hearing or vision impairment, multiple disabilities, orthopedic impairments and deaf-blindness.

^{bb} For more information, see <https://www.census.gov/programs-surveys/decennial-census.html>

^{cc} For more information, see <https://www.census.gov/programs-surveys/acs.html>

child care providers in Arizona who are active within the National Data System of Child Care NACCRRAware database; the Arizona Department of Education (ADE), which tracks preschool enrollment in public and charter schools; and First Things First (FTF), which administers the Quality First program. The ADHS child care licensing database was used as the primary source for child care capacity calculations in this report, as analyses of both statewide and region-level data showed that most child care slots for regulated providers in the region are provided by centers. Centers that only serve children ages 5-12 were removed from child care capacity calculations, as these are typically before- & after-school programs that only serve school-age children. This report also used data from the DES child care provider list to estimate the number of registered care providers and their capacity by type of provider: centers (including Head Start centers), schools and homes (both group home and family home providers). For all tables, providers were geocoded to regions and sub-regions using addresses or coordinates provided in the state agency datasets to assign them to regions and sub-regions. Comparisons of child care capacity to the young child population are meant to provide a relative assessment of the abundance or scarcity of child care supply relative to potential demand. The child care data in this report do not reflect the capacity of unlicensed, unregulated or informal child care providers in the region. The estimated supply may also over-estimate availability in regulated care as it did not account for child care providers that operate under licensed capacity by choice or children who enroll in multiple facilities (e.g., a child who attends part-day Head Start or school-based preschool in the morning and a child care center in the afternoon).

First Things First (FTF) strategy data. Data related to FTF-funded strategies were provided for this report by FTF staff. These data included regional estimates of oral health indicators and hearing, vision, socio-emotional and developmental screening reach, zip code-level service data for home visitation programs, statewide workforce registry wage data and provider-level Quality First participation and enrollment data. The vendor used an apportioning file provided by FTF to create regional estimates of home visitation services from the zip-code level file.

Early education and service data from the Arizona Department of Economic Security (DES). Data related to child care assistance, Arizona Early Intervention Program (AzEIP) referrals, outcomes and services, and Division of Developmental Disabilities services were provided by DES. These data were geocoded to regions and sub-regions by staff at DES using a custom shapefile provided by the vendor.

Health data from the Arizona Department of Health Services (ADHS). Data related to births, infant and maternal health, immunization rates at child care and school facilities, infant and child mortality and enrollment and participation in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) were provided by ADHS. All data apart from immunization data were geocoded to regions and sub-regions by staff at ADHS using a custom shapefile provided by the vendor. The vendor geocoded child care and school facilities to regions using

addresses or coordinates provided in the immunization datasets to create custom immunization coverage estimates.

Health data from the Arizona Health Care Cost Containment System (AHCCCS). FTF partnered with the Arizona State University Center for Health Information and Research (CHiR) to create custom tabulations of health claims data for young children birth to age 5 enrolled in AHCCCS health care plans. These estimates, at the state, county, regional and sub-regional levels, were provided to the vendor for inclusion in this report.

Employment and industry data from the Arizona Office of Economic Opportunity (OEO). Data for unemployment rates^{dd} and major employment sectors^{ee} were obtained from the OEO for counties and multi-county areas (which combine 2-4 small counties to produce a more reliable estimate). The top five employment sectors for each county or multi-county area reflect those with the most overall employees in Quarter 4 of 2024. The Quarterly Census of Employment and Wages, the underlying data source for these employment estimates, does not capture farm employment, so agricultural workers are not reflected in these data.

Education data from the Arizona Department of Education (ADE). For past FTF Regional Needs and Assets reports, regional estimates for education data were obtained through a custom tabulation of unredacted data files provided by ADE. Access to unredacted data files was not available for this report. Instead, publicly-available data files published by ADE^{ff} were used to examine trends in enrollment, assessment results, graduation and dropout rates, and data on chronic absenteeism were obtained via the Maricopa Association of Governments and ReadOn Arizona MAPLit data tool.^{gg} Due to the frequency of data suppression in these files to protect student privacy, data could not be reliably aggregated across schools or districts to create regional estimates. Data on services for students with disabilities by grade are not publicly available for geographies smaller than the state, so custom regional estimates from the 2024 Regional Needs and Assets reports were used in this report.

Change calculations. Unless otherwise specified, changes in counts of data over time (i.e., percent increase or decrease) are calculated by subtracting the earlier number (e.g., a 2010 count) from the later number (e.g. the 2020 count) and dividing the result by the earlier number (e.g. the 2010 count). This calculation provides the percent change between the most recent count and the prior count, relative to the prior count.

^{dd} For more information, see <https://oao.az.gov/labor-market/unemployment>

^{ee} For more information, see <https://oao.az.gov/labor-market/industry-employment>

^{ff} For more information, see <https://www.azed.gov/accountability-research/data>

^{gg} For more information, see <https://geo.azmag.gov/maps/readonaz/>

Data availability. State agency data in this report were provided to FTF by agency staff through a data request process initiated in February 2025 and extending to March 2026. Wherever possible, data were requested for multiple years to allow for the visualization of trends as well as for the most recent year available. However, due to both the constraints of agency staff and agency-maintained datasets as well as the timing of requests, not all data were available on the same time and geographic scales. This report attempts to include the most recent and complete data available, with notes indicating where data were not available for particular time periods or geographies.

Data suppression. To protect the confidentiality of program participants, the FTF Data Dissemination and Suppression Guidelines preclude reporting of social service and early education programming data if the count is less than 10 and data related to health or developmental delay if the count is less than 6. In addition, some data received from state agencies are suppressed according to their own guidelines. ADHS does not report counts between 1 and 5; DES does not report counts between 1 and 9; ADE does not report counts less than 11. Additionally, ADE requires suppression of the second-smallest value or the denominator in tables where a reader might be able to use the numbers provided to calculate a suppressed value. Throughout this report, information which is not available because of suppression guidelines is indicated by entries of "<6" or "<10" or "<11" for counts, or "DS" (data suppressed) for percentages. Data are sometimes not available for particular regions, either because a program did not operate in the region or because data are only available at the county level. Cases where data are not available will be indicated by an entry of "N/A", "NA" or a note that states "data not available."

SUB-REGIONAL FACTSHEETS

Communities vary in terms of needs and assets, even within the same First Things First (FTF) Region. In recognition of this, the following factsheets present a selection of indicators from this Regional Needs and Assets report at the sub-regional level. Examining differences within the region can help Regional Partnership Councils and local stakeholders focus their strategies and efforts to use resources effectively.

Sub-regions in the La Paz/Mohave Region

The factsheets that follow provide information about 10 sub-regions within the La Paz/Mohave Region.

The **Bullhead City** sub-region is defined as 13 census tracts (9514.01-9520.01) and contains Bullhead City.

The **Colorado City-Centennial Park** sub-region is defined as two census tracts (9501.02 & 9501.03) and contains the town of Colorado City and the CDPs of Centennial Park and Cane Beds.

The **Dolan Springs-Golden Valley** sub-region is defined as six census tracts and one block group (9504.01-8506.03 & 9548.02 block group 1) and contains the CDPs of Dolan Springs, Golden Valley, Meadview, White Hills, Chloride, So-Hi, Walnut Creek, McConnico and Katherine.

The **Fort Mohave-Mohave Valley-Topock** area is defined as eight census tracts and one block group (9405.01, 9520.03-9520.07, 9550.01, 9550.02 & 9548.02 block group 2) and contains the CDPs of Fort Mohave, Mohave Valley, Topock, Golden Shores, Arizona Village, Mojave Ranch Estates, Willow Valley and Mesquite Creek.

The **Kingman** sub-region is defined as 14 census tracts and one block group (9504.04, 9507.03-9507.08, 9536.02-9536.04, 9538-9539.02, 9549 & 9548.02 block group 4). It contains the city of Kingman and the CDPs of New Kingman-Butler, Lazy Y-U, Pinion Pines, Pine Lake, Valle Vista, Hackberry, Valentine, Truxton, Antares, Crozier, Wikieup and Yucca.

The **Lake Havasu City** sub-region is defined as 20 census tracts and one block group (9524-9534.06 & 9548.02 block group 3) and contains Lake Havasu City and the CDPs of Desert Hills and Crystal Beach.

The **Littlefield-Beaver Dam** sub-region is defined as one census tract (9501.01) and contains the CDPs of Beaver Dam, Littlefield and Scenic.

The **Parker Strip-Bouse** sub-region is comprised of two census tracts and two block groups (202.01, 202.02, 201.01 block group 2 & 205.01 block group 4). It contains the southernmost portion of the town of Parker that does not fall within the Colorado River Reservation and the CDPs of Cienega Springs, Parker Strip and Bouse.

The **Quartzsite-Ehrenberg** sub-region is defined as six census tracts and two block groups (205.03-205.05, 206.02, 9800 & 205.01 block groups 1 & 3) and contains the town of Quartzsite and the CDPs of Ehrenberg, La Paz Valley, Cibola and Brenda.

The **Salome-Wenden** sub-region is defined as two census tracts and one block group (201.02, 201.01 block group 1 & 205.01 block group 2) and contains the CDPs of Bouse, Salome, Wenden, Vicksburg, Utting, Alamo Lake and Sunwest.

A guide to the factsheets

Each factsheet contains data for a selection of indicators at the state, region and sub-regional level. Where possible, two timepoints are shown for each indicator with an arrow to indicate the direction of the trend (increase, decrease, no change) in the sub-region. In some cases, data were not available for a specific sub-region, indicated with **NA**. Additionally, some data were suppressed to protect individual data privacy in accordance with the FTF Data Policy, indicated with **DS**. The data in these factsheets were obtained through custom tabulations of publicly available data from the U.S. Census Bureau and through FTF requests to state agencies, specifically the Arizona Department of Health Services (ADHS), Arizona Department of Economic Security (DES) and the Arizona Health Care Cost Containment System (AHCCCS) via a partnership with the Arizona State University Center for Health Information & Research (CHiR). More details on how these tabulations and requests were made can be found in the *Maps & Methods Appendix* of this report.

The indicators included in each tabular factsheet are defined as follows:

Indicator	Description	Source
Total population	Overall population of all ages	2020 U.S. Census
Population of children (0-5)	Population of children birth to age 5	
Population living in poverty	Percent of the overall population living in households with incomes at or below the federal poverty threshold	2014-2018 & 2019-2023 American Community Survey (ACS) estimates
Children (0-5) living in poverty	Percent of children birth to age 5 living in households with incomes at or below the federal poverty threshold	
Low-income children (0-5) (<185% federal poverty level)	Number of children birth to age 5 living in households with incomes at or below 185% of the federal poverty level (the income eligibility threshold for WIC)	
Housing costs 30% or more of household income	Percent of households spending 30% or more of their household income on housing costs (i.e., considered “housing cost-burdened”)	
Children (0-5) with all present parents in the labor force	Percent of children birth to age 5 who live in households with all present parents who work or are looking for work (i.e., live with one parent who works or live with two parents, both of whom work)	
Language other than English spoken at home	Percent of households that speak Spanish or another language (other than English or Spanish). The most common languages spoken in the “Another” language category in Arizona are Native North American languages.	

First Things First 2026 Needs and Assets Report

Indicator	Description	Source
Ratio of children (0-5) to licensed child care slots	Number of children birth to age 5 per available licensed child care slots. An area is considered a child care desert when the ratio of children to slots exceeds 3.0.	2020 U.S. Census; Oct 2023 & Jan 2025 ADHS licensing datasets
Registered care providers in 2025	Number of registered early care and education providers and their licensed capacity to enroll children. Providers are shown by type: centers (including Head Start centers), schools and homes (both group home and family home providers). Please note that capacity numbers are often higher than actual enrollment.	2025 DES child care provider dataset
Children (0-5) receiving child care assistance	Number of children birth to age 5 receiving DES child care assistance (not including those involved in the child welfare system)	2023 & 2024 DES
Educational attainment (ages 25 and older)	Percent of adults with at least a high school education (i.e., a high school diploma, some college, an associate, Bachelor's or advanced degree) or a Bachelor's degree or more (i.e., a Bachelor's or advanced degree)	2014-2018 & 2019-2023 ACS estimates
Unemployment rate for the adult population (ages 16 and older)	Percent of adults who self-reported that they were unemployed	
Total births	Total number of births in the area, based on address provided on the birth certificate	2020-2021 & 2022-2023 ADHS Vital Statistics dataset
Maternal age 19 or younger	Percent of births to mothers age 19 or younger	
Low birth weight (<2500 grams)	Percent of babies born weighing 2,500 grams or less	
Preterm births (<37 weeks)	Percent of babies born at 37 weeks of gestation or earlier. The Healthy People 2030 target is 9.4% or less.	
Prenatal care (5+ prenatal visits)	Percent of births to mothers who had at least five prenatal visits	
Number of children (0-5) with AHCCCS	Number of children birth to age 5 enrolled in an insurance plan through the Arizona Health Care Cost Containment System (AHCCCS)	2022 & 2024 AHCCCS claims data processed by ASU CHiR
AHCCCS-enrolled children (0-5) with at least 1 primary care provider visit	Percent of children birth to age 5 enrolled in AHCCCS who had a claim for at least one primary care visit	
Children (0-5) receiving AzEIP, DDD or both services	Number of children birth to age 5 who received AzEIP, DDD or both services	SFY 2023 & 2024 DES
